# FORTRAN IV PROGRAM FOR CALCULATION OF THERMODYNAMIC DATA

by Bonnie J. McBride and Sanford Gordon

Lewis Research Center

## SUMMARY

A FORTRAN IV program is described which (1) calculates thermodynamic functions (heat capacity, enthalpy, entropy, and free energy), (2) fits these functions to empirical equations, and (3) calculates, as a function of temperature, heats of formation and equilibrium constants.

The program provides several methods for calculating ideal gas properties. For monatomic gases, three methods are given which differ in the technique used for truncating the partition function. For diatomic and polyatomic molecules, five methods are given which differ in the corrections to the rigid-rotator harmonic-oscillator approximation.

In addition the program provides for calculating thermodynamic functions for solids, liquids, and gases from empirical heat capacity equations.

## INTRODUCTION

Numerous compilations of thermodynamic data are available (refs. 1 to 12). However, there is a continuing need for additional calculations due to (1) discovery of new species, (2) revision of existing molecular constant data and structural parameters, (3) need for data at temperatures other than already published, (4) availability of new or revised heats of formation, dissociation, or transition, (5) revision of fundamental constants or atomic weights, and (6) preference for thermodynamic data in functional rather than tabular form. Calculations may also be needed to compare the results of assuming various possible forms of the partition function.

For these reasons, a flexible FORTRAN IV program has been prepared for the IBM 7094 which can perform any combination of the following: (1) calculate thermodynamic functions (heat capacity, enthalpy, entropy, and free energy) for any set of 1 to

200 temperatures, (2) fit the functions to empirical equations, and (3) calculate, as a function of temperature, heats of formation and equilibrium constants from assigned reference elements and/or from these elements in their atomic gaseous state.

The thermodynamic functions for ideal gases may be calculated from molecular constant data using one of several partition function variations provided by the program. For monatomic gases, (1) one of three partition function cutoff techniques may be selected and (2) unobserved but predicted electronic energy levels may be included by the program. For diatomic and polyatomic gases, (1) one of five partition functions may be selected which differ in the correction factors for nonrigid rotation, anharmonicity, and vibration-rotation interactions and (2) excited electronic states may be included.

For the purpose of additional processing, known thermodynamic functions for solids, liquids, or gases may be (1) calculated from heat capacity equations or (2) read in directly from IBM cards.

Because of the variety of options provided and the resulting variety of input data required, an objective was to provide for a relatively simple procedure for reading input data. This was accomplished by means of a uniform input format.

The program and the equations used are described in detail. Examples of input and output are given for several typical species.

## CALCULATION OF IDEAL GAS THERMODYNAMIC FUNCTIONS

For gaseous species, the thermodynamic functions may be calculated from spectroscopic constants. A general discussion of methods of calculation is given in reference 3. Many of the equations will be repeated here for convenience. The properties are expressed as functions of the internal partition function  $Q$ ; that is,

$$\frac{C_p^0}{R} = T^2 \frac{d^2(\ln Q)}{dT^2} + 2T \frac{d(\ln Q)}{dT} + \frac{5}{2} \quad (1)$$

$$\frac{H_T^0 - H_0^0}{RT} = T \frac{d(\ln Q)}{dT} + \frac{5}{2} \quad (2)$$

$$\frac{S_T^0}{R} = T \frac{d(\ln Q)}{dT} + \ln Q + \frac{3}{2} \ln M + \frac{5}{2} \ln T + S_c + \frac{5}{2} \quad (3)$$

$$-\frac{F_T^0 - H_0^0}{RT} = \frac{S_T^0}{R} - \frac{H_T^0 - H_0^0}{RT} = \ln Q + \frac{3}{2} \ln M + \frac{5}{2} \ln T + S_c \quad (4)$$

where

$$S_c = \ln \left[ k \left( \frac{2\pi k}{N_o h^2} \right)^{3/2} \right] \quad (5)$$

(Symbols are defined in appendix A).

The internal partition function  $Q$  in equations (1) to (4) is given by

$$Q = \sum_{m=1}^L Q^m \quad (6)$$

where  $Q^m$  is the internal partition function for the  $m^{\text{th}}$  electronic state and  $L$  is the number of electronic states.

### Internal Partition Functions for Monatomic Gases

For monatomic molecules, internal energy consists of electronic energy only. Equation (6) then becomes

$$Q = \sum_{m=1}^L Q_e^m = \sum_{m=1}^L (2J_m + 1)e^{-\epsilon_m/kT} = \sum_{m=1}^L g_m e^{-\epsilon_m/kT} \quad (7)$$

where  $Q_e^m$ ,  $J_m$ ,  $\epsilon_m$ , and  $g_m$  are the electronic energy partition function, total angular momentum quantum number, electronic excitation energy, and statistical weight, respectively, for the  $m^{\text{th}}$  electronic state.

Cutoff methods. - An infinite number of bound states exists below the ionization limit for a hypothetical isolated atom ( $L = \infty$  in equation (7)). Inasmuch as the partition function diverges and approaches infinity as  $L \rightarrow \infty$ , the summation must be cut off. A recent review of various cutoff methods is given by reference 13. These cutoff methods may be considered to be of the following types:

- (1) No dependence on temperature or pressure

(2) Dependence on temperature only

(3) Dependence on temperature and pressure (or density) and possibly degree of ionization

In the first of the three types, the summation may include various numbers of levels. For example, only the ground state is used in the Saha equation (see ref. 14). The summation of equation (7) may be over a fixed and usually arbitrary number of levels (such as for lithium in ref. 15 or for all species in ref. 11) or equation (7) may be summed through all observed levels (as in ref. 2, for example).

The second cutoff type is temperature dependent. The ionization potential is reduced by a quantity referred to as the "ionization potential lowering," which in this case is a function of temperature only. The partition function is then permitted to include only those levels below the "lowered" ionization potential. Reference 16 suggested that the ionization potential be lowered by an amount equal to the temperature function  $kT$ . This suggested method was used in reference 3. Other temperature functions are summarized in reference 13.

The first two cutoff types are distinguished by the fact that they permit the partition function and related thermodynamic properties to be calculated as functions of temperature only. For the third type, it is not possible to calculate the partition function by specifying temperature only. One cutoff technique of this type relates the highest permitted principal quantum number  $n$  to the number of particles per unit volume (number density) such as suggested by Bethe (see discussion in ref. 13). Another technique uses the ionization potential lowering procedure previously described, but in this case the quantity by which the potential is lowered is a function of electron and ionized particle number densities. Several such quantities are summarized in reference 13.

This last technique involves mixtures of species and therefore precludes, for all practical purposes, the possibility of generating tables for individual species as a function of temperature only. This is due to the fact that the cutoff criterion needed to calculate the partition function depends on mixture composition, while the calculation of mixture composition depends on the partition function. Thus an iterative procedure is required where the partition function at a specified temperature may be changing from one iteration to the next. Consequently, only the first two cutoff types are considered in this report.

Inclusion of predicted levels. - In addition to the divergence problem, there is the problem of whether to include observed energy levels only or also to include levels for predicted terms which, so far, have not been observed. From atomic theory, as presented in texts such as reference 17, predicted terms can be derived. Some of these terms are given in tables 10 and 11 in reference 17 and tables 5 to 20 in references 18 to 20. An examination of the tabulated observed terms in references 18 to 20 shows that many predicted terms are missing, especially for the higher quantum numbers.

It has been shown that various series of levels can be represented by formulas such as the Rydberg or the Rydberg-Ritz formulas (e.g., ref. 21). The constants in these formulas can be determined from known levels and used to extrapolate for the unobserved levels. However, the number of observed levels differ from species to species and, therefore, some judgment must be exercised in obtaining these constants. Thus, while in principle this technique of obtaining predicted, but unobserved, levels can be programmed, in practice it amounts to essentially a special program for each species. Therefore, this technique was not considered further for this program.

An alternate, but considerably simpler, technique for filling in unobserved levels, which gives essentially the same results for the partition function for many species as does the use of the Rydberg-Ritz equations, was included in the program. This alternate technique will now be described.

By examining the statistical weights  $g_i$  corresponding to predicted terms, it was determined that for at least the first 20 chemical elements, the sum of the statistical weights could be expressed by the following simple function of the principal quantum number  $n$  (except for the ground state  $n$  of most species)

$$\sum g_i = \sum (2J_i + 1) = bn^2 \quad (8)$$

Atomic number	Chemical symbol	Constant in equation (8), b	Sum of statistical weights for ground state, $\sum g_i$
1	Hydrogen	2	2
2	Helium	4	1
3	Lithium	2	8
4	Beryllium	4	13
5	Boron	2	6
6	Carbon	12	15
7	Nitrogen	30	20
8	Oxygen	40	15
9	Fluorine	30	6
10	Neon	12	1
11	Sodium	2	18
12	Magnesium	4	33
13	Aluminum	2	16
14	Silicon	12	75
15	Phosphorus	30	170
16	Sulfur	40	215
17	Chlorine	30	156
18	Argon	12	61
19	Potassium	2	32
20	Calcium	4	61

Equation (8) applies only to terms arising from excitation of the emission electron and does not account for other possible terms. The table at the left lists (1) the derived constants  $b$  to be used in equation (8) to obtain  $\sum g_i$  for any  $n$  above the ground state and (2)  $\sum g_i$  values for the ground state.

The usefulness of equation (8) arises from the fact that the inclusion of an unobserved level generally makes considerably more difference than a small error in the estimated energy for this level. Therefore, an option is provided in the program to determine for each  $n$  the difference in statistical weight sums between the observed levels which have been read in as input and that given by equation (8). The program then assigns to this difference the

highest observed level for the corresponding  $n$  and includes it with the observed levels.

This method of "filling in" predicted, but unobserved, levels by means of equation (8) was used to calculate the thermodynamic functions of the atomic species in reference 3.

### Internal Partition Function for Diatomic and Polyatomic Molecules

For diatomic and polyatomic molecules,  $Q^m$  in equation (6) involves vibrational and rotational as well as electronic energy. In this report the following factored form is used to calculate  $Q^m$ :

$$Q^m = Q_e^m Q_V^m Q_R^m Q_\rho^m Q_\theta^m Q_W^m Q_c^m$$

or

$$\ln Q^m = \ln Q_e^m + \ln Q_V^m + \ln Q_R^m + \ln Q_\rho^m + \ln Q_\theta^m + \ln Q_W^m + \ln Q_c^m \quad (9)$$

The quantities  $Q_e^m$ ,  $Q_V^m$ , and  $Q_R^m$  are the electronic, harmonic-oscillator, and classical-rotation contributions to the partition function, respectively, as given in standard texts (see refs. 22 to 25). The remaining quantities in equation (9) are as follows: rotational stretching  $Q_\rho^m$  (ref. 25 or 26), low-temperature rigid rotation  $Q_\theta^m$  (refs. 25 and 27), Fermi resonance  $Q_W^m$  (ref. 28), and both anharmonicity and vibration-rotation interaction  $Q_c^m$  (refs. 29 to 31).

The program provides five methods of calculating the partition function which vary in the inclusion of and formulas for the correction terms ( $\ln Q_\rho^m$ ,  $\ln Q_\theta^m$ ,  $\ln Q_W^m$ , and  $\ln Q_c^m$ ). This provision is made so that the results of the various methods may be compared.

Table I contains detailed formulas for all the  $\ln Q^m$  terms and their derivatives except those for  $\ln Q_c^m$  which are given in table II. The derivatives of  $\ln Q_c^m$  are not given directly as are the derivatives in table I. It was found to be considerably more convenient to express the derivatives of  $\ln Q_c^m$  by means of general formulas than to obtain the derivatives directly. These general formulas are given in a footnote of table II.

### EMPIRICAL EQUATIONS FOR THERMODYNAMIC FUNCTIONS

Empirical equations for thermodynamic functions are often used for convenience.

These equations are usually based on the following form for heat capacity:

$$C_p^o = \sum_{i=1}^r a_i T^{q_i} \quad (10)$$

Enthalpy and entropy are related thermodynamically to  $C_p^o$  as follows:

$$H_T^o = a_{r+1} + \int C_p^o dT \quad (11)$$

$$S_T^o = a_{r+2} + \int \left( \frac{C_p^o}{T} \right) dT \quad (12)$$

where  $a_{r+1}$  and  $a_{r+2}$  are integration constants.

The program uses equations (10) to (12) in two ways, either in generating the coefficients  $a_i$  from a set of thermodynamic data using the least-squares technique given in reference 32, or conversely, in generating the thermodynamic data from the empirical equations. The least squares method differs from the usual least squares treatment in that it simultaneously fits heat capacity, enthalpy, and entropy.

## ASSIGNED ENTHALPY VALUES

For some applications (see ref. 33) it is convenient to combine sensible enthalpy and energies of chemical and physical changes into one numerical value. An arbitrary base may be adopted for assigning absolute values to the enthalpy of the various substances, inasmuch as only differences in enthalpy are measurable. For example, the arbitrary base selected in reference 3 was a value of zero at  $298.15^\circ K$  ( $H_{298.15}^o = 0$ ) for a selected set of elements. This selection makes the assigned value,  $H_{298.15}^o$ , of any substance equal to its heat of formation at  $298.15^\circ K$  from this set of selected elements.

## ASSIGNED REFERENCE ELEMENTS

The designation of an element in a particular phase to be a reference element is needed in order that values of heats of formation and equilibrium constants be unambiguously related to specific reactions. Some reference elements which are commonly

found in the literature are the following (see ref. 3): the inert gases, He, Ne, and Ar; the diatomic gases, H<sub>2</sub>, N<sub>2</sub>, O<sub>2</sub>, F<sub>2</sub>, and Cl<sub>2</sub>; and the condensed elements, Li(c,l), Be(c,l), B(c,l), C(graphite), Na(c,l), Al(c,l), Si(c,l), P(c IV, c III, l), and S(c II, cI, l) where c is a crystal phase and l is a liquid phase. Assigned reference elements used for the examples in this report were taken from this set.

## HEATS OF FORMATION AND EQUILIBRIUM CONSTANTS

In the program described in this report, heats of formation and log K for a species are calculated as a function of temperature for two reactions. These reactions are for the formation of the species from the elements in either their assigned reference state discussed previously or in their atomic gaseous state.

The following are examples of how these properties are calculated for CO(g) at 1000° K:

Relative to reference elements,

$$\Delta H_{1000}^{\circ} = (H_{1000}^{\circ})_{CO(g)} - (H_{1000}^{\circ})_{C(graphite)} - \frac{1}{2} (H_{1000}^{\circ})_{O_2(g)} \quad (13)$$

$$\Delta F_{1000}^{\circ} = (F_{1000}^{\circ})_{CO(g)} - (F_{1000}^{\circ})_{C(graphite)} - \frac{1}{2} (F_{1000}^{\circ})_{O_2(g)} \quad (14)$$

or relative to gaseous atoms,

$$\Delta H_{1000}^{\circ} = (H_{1000}^{\circ})_{CO(g)} - (H_{1000}^{\circ})_{C(g)} - (H_{1000}^{\circ})_{O(g)} \quad (15)$$

$$\Delta F_{1000}^{\circ} = (F_{1000}^{\circ})_{CO(g)} - (F_{1000}^{\circ})_{C(g)} - (F_{1000}^{\circ})_{O(g)} \quad (16)$$

By definition,

$$\log_{10} K = \frac{-\Delta F_T^{\circ}}{2.3025851 RT} \quad (17)$$

## COMPUTER PROGRAM

The computer program was written for an IBM 7094 with 32 thousand core storage

and IBM 1403 printers with 132 print positions. FORTRAN tape 3 is used as a binary scratch tape. Input and output tapes are FORTRAN tapes 5 and 6, respectively.

The program consists of a main routine and 17 subroutines written in FORTRAN IV and, in addition, five Lewis Research Center subroutines written in 7094 MAP assembly language. A listing of the FORTRAN program is given in appendix B and a discussion of the routines is given later.

A listing and brief discussion of the five Lewis subroutines (named SKFIL<sub>E</sub>, BCDUMP, BCREAD, IALS, and IARS) are given in appendix C. These MAP routines require version 13 IBSYS operating system.

## Availability to Other Organizations

The source program decks will be made available on written request to the authors. The input data used for the examples in this report will be included for check out purposes. In addition, for use in calculating log K, the enthalpy and free energy data for at least the first 18 elements in their atomic gas as well as their assigned reference state will be included. These data are essentially those of reference 2.

The following sections give a general discussion of the program. Included in this discussion are options, input, output, general flow of the program, and subroutines.

## Options

The program provides a choice of several methods for calculating the thermodynamic functions  $C_p^{\circ}$ ,  $H_T^{\circ} - H_0^{\circ}$ ,  $H_T^{\circ} - H_{298.15}^{\circ}$ ,  $S_T^{\circ}$ ,  $-(F_T^{\circ} - H_0^{\circ})$ , and  $-(F_T^{\circ} - H_{298.15}^{\circ})$ . For ideal gases, these functions may be obtained from one of several assumed forms of the partition function or else from empirical equations. For solids and liquids, the thermodynamic functions may be calculated only from empirical equations. In addition, thermodynamic functions for any phase of a species may be read directly from cards for additional processing.

The program also has two other capabilities which are optional: (1) least-squares fitting of the thermodynamic functions to empirical equations (eqs. (10) to (12)) and (2) calculating heats of formation and log K values for the same temperature range as the functions.

The following is a discussion of these optional features.

Partition functions - monatomic gases. - The partition function for monatomic gases is given by equation (7). The program permits three optional ways of terminating the number of energy levels L to be included in calculating this partition function.

These three options, indicated by their program code names given in capital letters, are: (1) ALLN - inclusion of all electronic levels in the input data, (2) FIXEDN - inclusion of all levels through a specified principal quantum number  $n$ , and (3) TEMPER - inclusion of all energy levels that are less than or equal to the ionization potential lowered by an amount  $kT$  (see section Cutoff methods).

With any of these three cutoff options, an additional option (FILL) is provided to include predicted but unobserved levels automatically (see discussion in the section Inclusion of predicted levels).

Partition functions - diatomic and polyatomic gases. - For diatomic and polyatomic gases, the program provides for a selection of five methods of calculating the partition function which varies in the inclusion of and formulas for the correction terms ( $\ln Q_p$ ,  $\ln Q_\theta$ ,  $\ln Q_W$ , and  $\ln Q_c$ ) in equation (9). The formulas for the  $\ln Q$  terms included in each of the five methods are given in tables I and II. If certain spectroscopic constants are not available as input, the program automatically excludes those  $\ln Q$  terms involving them. The methods (with their program code names in parentheses) are as follows:

(1) Rigid-Rotator Harmonic-Oscillator (RRHO) approximation - This method excludes all the correction terms in equation (9) (i. e.,  $\ln Q_p$ ,  $\ln Q_\theta$ ,  $\ln Q_W$ , and  $\ln Q_c$ ).

(2) Modified Pennington and Kobe (PANDK) method - The formulas given in table II for  $\ln Q_c$  are similar to those given in reference 29. The method in this report is equivalent to the one described in reference 3 except for the formula for  $\ln Q_\theta$  (formula 6 in table I). All correction terms in equation (9) are included with the exception of the Fermi resonance  $\ln Q_W$  as indicated in table I.

(3) Joint Army Navy Air Force (JANAF) method - This method is described and used in reference 2. For diatomic molecules, it is the same as the PANDK method except for the definitions of  $a_1$  and  $X_{11}$  which are used in formulas 9 and 12, respectively, in table II. For polyatomic molecules, the JANAF method is the same as the RRHO method.

(4) Nonrigid-Rotator Anharmonic-Oscillator 1 (NRRAO1) - In addition to the  $\ln Q_\theta$  and  $\ln Q_p$  terms, all the  $\ln Q_c$  terms given in references 30 and 31 were included which do not contain a  $(c_2/T)^2$  or  $(c_2/T)^3$  factor.

(5) Nonrigid-Rotator Anharmonic-Oscillator 2 (NRRAO2) - This method includes the same  $\ln Q_c$  terms as NRRAO1 with the addition of  $\ln Q_c$  terms from references 30 and 31 which contain  $(c_2/T)^2$  factors.

Thermodynamic functions from empirical equations. - The routine for calculating thermodynamic functions from the empirical equations (eqs. (10), (11), and (12)) has the following features:

- (1) The value of  $r$  (number of coefficients  $a_i$ ) may be any number from 1 to 10.
- (2) The temperature exponents  $q_i$  may be any positive or negative numbers or zero.

(3) Any number of sets of  $a_i$  and  $q_i$  may be read in for various temperature intervals for a particular species.

(4) The integration constants,  $a_{r+1}$  and  $a_{r+2}$  may be read in or calculated by the program from the enthalpy and entropy values, respectively, for a specific temperature.

(5) When a phase transition occurs, the integration constants,  $a_{r+1}$  and  $a_{r+2}$  for the second phase may be read in or calculated by the program from either the enthalpy or entropy of transition.

(6) There is an option to punch on binary cards up to five coefficients and two integration constants for each temperature interval. This option has been included in order to provide thermodynamic data in the form required by reference 33.

Least-squares fit. - The least-squares routine fits the thermodynamic functions to equations (10), (11), and (12). The routine has the following features:

(1) The value of  $r$  (number of coefficients  $a_i$ ) may be any number from 1 to 10.

(2) The temperature exponents  $q_i$  may be any positive or negative numbers or zero.

(3) An option is provided to permit the data to be divided into any number of specified intervals from 1 to 9. The purpose in providing for several intervals is to increase the accuracy of the fit.

(4) The equations for each temperature interval are constrained at an endpoint to fit either the original data or the values obtained from fitting an adjacent interval. The purpose of these constraints is to give equal values of the functions at the common point and thus avoid discontinuities between consecutive intervals. However, only one temperature may be specified in the input for which the fitted equations reproduce the original values. (If no temperature is specified, the program assigned  $1000^{\circ}$  K.)

(5) For two or more phases, the data for each phase is fitted separately and the equations constrained to fit the original data at the transition point.

(6) For each temperature interval, up to five of the coefficients  $a_i$  plus the two integration constants will be punched on binary cards. These cards are made in order to provide thermodynamic data in the form required by reference 33.

Heat of formation and log K values. - The program provides an option for calculating heats of formation and log K values as a function of temperature for two reactions. The reactants for these two formation reactions are either monatomic gases or assigned reference elements (see sections Assigned Reference Elements and Heats of Formation and Equilibrium Constants).

Heats of formation and log K values for a particular species can be calculated if the necessary enthalpy and free energy data for the reactants as well as for that species are available. Therefore the monatomic gases and assigned reference elements are processed first. For these reactants, there is an option to reserve the enthalpy and free energy data in two ways: (1) by writing the data on tape and (2) by punching the data on cards. The data on tape are saved only for use with other species being processed

during the same computer run. For later computer runs, the data on the binary cards may be read in as part of the input and, if so, are automatically put on tape.

If there is a temperature in the data for a particular species which is not contained in the data on tape for the required reactants, the reactant data are interpolated using three-point Lagrangian interpolation.

## Input

Types of data. - The input data are grouped into two categories; namely, general and specific. General data are read into storage and retained for use with any number of species to be processed in any particular computer run. Physical constants, atomic weights, and reactant enthalpy and free energy values fall into this category of input data. (See previous section.)

On the other hand, a set of specific data cards is required for each species to be processed. The data in each set are read, processed, and cleared before the next set is read. A set of specific data cards for a diatomic gas would contain the chemical formula; the method of calculation, such as PANDK; molecular data such as  $\omega_e$ ,  $\omega_e^x$ ,  $B_e$ , and  $\alpha_e$ ; desired options such as a least-squares fit or a special temperature schedule; and finally, a card to indicate the end of the set of specific data.

Identification of cards. - All input cards will be referred to in one of the following three ways:

(1) Most cards will be identified by the code word punched in card columns 1 to 6. For example, the input card containing physical constants has the code CONSTS in these columns. Thus, this card will be referred to as the CONSTS card.

(2) The first card of a set of specific data cards has the chemical formula punched in card columns 1 to 12. This card will be referred to as a formula card. The word "formula" does not appear on the card.

(3) Column binary cards containing enthalpy and free energy data for the reactants will be referred to as binary EF data cards. The word "EF data" does not appear on the card.

Uniform format. - All cards of types (1) and (2) are read with a single format which will be referred to as the uniform format. Format details are given in appendix D.

Contents of individual cards. - A brief description of the contents of the individual cards is given in table III. (Detailed descriptions are given in appendix D.) The right-hand column indicates which cards are optional. Table III indicates that the card code in card columns 1 to 6 is a mnemonic device which does one or more of the following:

- (1) Indicates what data are on the card (i. e., CONSTS, ATOM, EFDATA, TEMP, LSTSQS and DATA)

- (2) Indicates an option discussed in the section Options (i. e., LOGK, LSTSQS, EFTAPE, and METHOD)
- (3) Identifies the data on the binary cards which follow it (i. e., EFDATA)
- (4) Calls for some intermediate output (i. e., LISTEF and INTERM)
- (5) Identifies the input data sources (i. e., REFNCE) or gives a date (i. e., DATE)
- (6) Indicates the end of a set of specific data (i. e., FINISH)

## General Flow of Program

The general flow of the program is given in figure 1. For convenience in locating various sections of the FORTRAN program, 79 location numbers, referred to as C10, C20, . . . , C790, were included as comments in the program. Some of these location numbers are also shown in figure 1. Subroutine names are given in parentheses.

From figure 1, the following are evident:

- (1) Each card (except for the binary EF data cards) is read and listed. The flow is directed according to the code in card columns 1 to 6.
- (2) The general data storage is cleared only at the beginning of each computer run. Thus, these data are retained as they are read in.
- (3) The order of the general data is immaterial except for the fact that the EF DATA and binary EF data cards must remain in sets for each reactant.
- (4) The specific data (including options) are cleared at the beginning of the program and after each FINISH card.
- (5) There may be any number of sets of specific data - each having any combination of options.
- (6) The order of the optional cards (EFTAPE, LOGK, LSTSQS, INTERM, DATE, and REFNCE) in the specific data is immaterial.
- (7) The temperature schedule (TEMP cards), if not the standard 100 (100) 6000<sup>0</sup> K, must be read before the METHOD card.
- (8) The DATA cards must follow the METHOD cards.
- (9) Any card which is not recognized by the code in card columns 1 to 6 is assumed to be a formula card.
- (10) From the chemical formula, the following items are determined by the program:
  - (a) the molecular weight
  - (b) the phase of the species
  - (c) the number of atoms (i. e., whether species is monatomic, diatomic, or polyatomic)
- (11) The H<sub>0</sub><sup>o</sup> value may be calculated from an assigned value at any temperature or a heat of reaction (see formula card in appendix D). (The H<sub>0</sub><sup>o</sup> value is used in calcu-

lating  $\Delta H_T^0$  and  $\log K$  and the integration constants  $a_{r+1}$  (eq. (11)).

(12) Thermodynamic functions are calculated immediately after the DATA cards are read.

(13) After the FINISH card is read,  $H_0^0$  is calculated, the least-squares fit option is checked, tables of thermodynamic functions are listed, and the  $\Delta H_T^0$  and  $\log K$  option is checked.

(14) General data may be modified or added following any FINISH card. If a second CONSTS card, ATOM card for a particular atom, or a second set of EFDATA and binary EF data cards for a particular reactant is read, the data on these cards will be used for succeeding calculations.

(15) With an EFTAPE option card in a set of specific data, EFDATA and binary EF data cards are punched and the data are put on tape. The data on tape will be available for use with any succeeding calculations in the same computer run.

(16) Any number of sets of METHOD and corresponding DATA cards may be read for a set of specific data. This is useful for species with more than one phase in the temperature range of interest. For example, the thermodynamic functions for the solid may be read in directly while the liquid data may be obtained from empirical equations. The data for both phases will appear in the same listed tables of the thermodynamic properties.

A feature of the program which is not indicated in the flow diagram is that contributions of excited electronic states may be included in the calculation of the thermodynamic functions for diatomic and polyatomic gases. There may be any number of states, each having its own set of molecular constants. This is accomplished by grouping the DATA cards for each state together with a code number in card columns 79 and 80. The values of  $Q^m$ ,  $T dQ^m/dT$ , and  $T^2 d^2Q^m/dT^2$  are calculated after the DATA cards for each state are read. These values are summed as they are calculated.

## Output

A brief description of punched card and listed output is given in this section; a detailed description is given in appendix E.

Punched card output. - Cards are punched with certain options as indicated by the following:

(1) With an EFTAPE specific data card, an EFCDATA card and binary EF data cards are punched.

(2) With a LSTSQS card, column binary cards are punched which contain the chemical formula of the species, the temperature intervals, and the least-square coefficients (eqs. (10) to (12)).

(3) With DATA cards which contain coefficients (eqs. (10) to (12)) as well as a TPUNCH code, the coefficients will be punched in the same format as item (2). (The TPUNCH code is described in appendix D and its uses illustrated in example 5, appendix F.)

Listed output. - The following data are always listed:

- (1) The contents of all input cards in the uniform format
- (2) Table of T,  $C_p^0/R$ ,  $(H_T^0 - H_0^0)/RT$ ,  $(H_T^0 - H_{298.15}^0)/RT$ ,  $S_T^0/R$ ,  $-(F_T^0 - H_0^0)/RT$ ,  $-(F_T^0 - H_{298.15}^0)/RT$ ,  $H_T^0/RT$ , and  $-F_T^0/RT$
- (3) Table of T,  $C_p^0$ ,  $H_T^0 - H_0^0$ ,  $H_T^0 - H_{298.15}^0$ ,  $S_T^0$ ,  $-(F_T^0 - H_0^0)$ ,  $-(F_T^0 - H_{298.15}^0)$ ,  $H_T^0$ , and  $-F_T^0$

The following data are listed only with the indicated options:

- (1) With a LISTEF card, the contents of the binary EF data cards are listed.
- (2) With an INTERM card included in the specific data of a particular species, intermediate data are listed as detailed in appendix E.
- (3) With a LSTSQS card, the following data are listed for each temperature interval fitted:
  - (a) The thermodynamic functions (both the original and those obtained from the least-squares fit)
  - (b) The errors between the original and the fitted data
  - (c) The least-squares equation for heat capacity and the integration constants (eqs. (10) to (12))
  - (d) The contents of the punched binary cards (see item (2) in the section Punched card output)

- (4) With a LOGK card, two tables are listed:

- (a) Table of T,  $C_p^0/R$ ,  $(H_T^0 - H_0^0)/RT$ ,  $S_T^0/R$ ,  $-(F_T^0 - H_0^0)/RT$ ,  $H_T^0/RT$ ,  $-F_T^0/RT$ , and  $\Delta H_T^0/RT$  and  $-\Delta F_T^0/RT$  for formation of the species from both assigned reference elements and monatomic gases
- (b) Table of T,  $C_p^0$ ,  $H_T^0 - H_0^0$ ,  $S_T^0$ ,  $-F_T^0$ , and  $\Delta H_T^0$  and  $\log_{10} K$  for the same reactions as the previous table

## Examples

Sample problems with punched card input and listed output are given in appendix F.

## Main Routine and Subroutines

The FORTRAN listing in appendix B has a number of comments to indicate the operations of various sections of the program as well as location numbers C10, C20, . . . , C790. A short description of each subroutine follows.

PAC1(C10 to C60). - This is the main routine and directs the general flow of the program as given in figure 1 and discussed in the section General Flow of the Program. Subroutines called by PAC1 are indicated in figure 1 in parenthesis in or near the appropriate boxes.

INPUT(C70). - This routine reads and lists all cards that have been punched in the uniform format. The output format for listing numerical values is varied according to the size of the numbers.

PAGEID(C80). - This routine lists the chemical formula at the bottom of a page in the output listing and skips to a new page. The program allows approximately 55 lines to be printed on a page.

EFTAPE(C90 to C130). - This routine (1) reads binary EF data cards, (2) punches new sets of EFDATA and binary EF data cards, and (3) stores these data on tape.

IDENT(C140 to C160). - This routine analyzes the chemical formula on either the formula card or the EFDATA card. It separates and stores each chemical symbol and corresponding number of atoms in the chemical formula. The chemical symbols are matched in the SYMBOL array and corresponding indexes are stored.

When analyzing a chemical formula from a formula card, the molecular weight is calculated.

TEMPER(C170 to C180). - This routine stores the temperature schedule as given on one or more TEMP cards. It is called from PAC1 after a TEMP card has been read.

RECO(C190 to C250). - This routine processes the METHOD and DATA cards for methods READIN and COEF. The routine is called from PAC1 after a METHOD card has been read with either a COEF or READIN code. The RECO routine calls INPUT to read the DATA cards plus the next card.

For READIN, the thermodynamic functions on each card are simply stored. For COEF, the thermodynamic functions are calculated and stored.

The RECO routine is also used to relate the enthalpy of two phases of the same species by means of an enthalpy or entropy of transition. One of these transition values is given on the METHOD card of the second phase (DELTAB or DELTAS code described in appendix D) and used to calculate the enthalpy of the second phase at the transition temperature. The free energy value of the second phase is taken to be equal to the free energy value of the first phase at the transition temperature.

If a transition is present, the routine calls DELH (discussed in the section DELH(C510 to C530)) to check for the options of least-squares fit or punching coefficients for

the first phase.

ATOM(C260 to C310). - This routine calculates thermodynamic functions for monatomic gases.

The routine calls INPUT to read all DATA plus the next card. The J values, which are read with an alphanumeric format, are changed to floating point numbers and stored.

Energy levels are sorted in order of increasing energy values. The number of levels included in the calculations is determined by the cutoff method (ALLN, FIXEDN, or TEMPER) given on the METHOD card. Predicted but unobserved levels will be included with the FILL option.

POLY(C320 to C410). - This routine calculates thermodynamic functions for diatomic and polyatomic gases.

Subroutine INPUT is called to read the DATA cards plus the next card. Subroutine LINK1 is called to calculate the partition function according to the method specified (RRHO, PANDK, JANAF, NRRAO1, or NRRAO2).

If more than one electronic state is present, the various states are identified by a code in card columns 79 to 80. In this case, DATA cards for only one state at a time are read in and stored. The partition function for each state is calculated prior to processing DATA cards for the next state.

LINK1(C420 to C480). - This routine calculates the partition function for diatomic and polyatomic molecules. The formulas given in tables I and II are evaluated according to the method specified.

The routine is called from subroutine POLY. LINK1 in turn calls two subroutines, DERIV to calculate the derivatives of the partition function and QSUM to keep a running total of the various contributions to the partition function.

KD(C480). - This function subprogram calculates Kronecker delta.

DERIV(C490). - This routine calculates the derivatives of the partition function using the method given in the footnote of table II. The routine is called from a number of places in LINK1.

QSUM(C500). - This routine keeps a running total of all, except translational, contributions to the partition function and its derivative for each electronic state. These contributions are listed if an INTERM card has been included in the input.

QSUM is called from a number of places in LINK1.

DELH(C510 to C530). - This routine calculates the  $H_0^0$  value, calls LEAST for the least-squares fit option, and calls PUNCH for the option of punching coefficients read with the COEF method. The information given on the formula card ( $\Delta H_T^0$  of formation,  $D_T^0$ ,  $H_T^0$ , T) is used in calculating the  $H_0^0$  value.

The routine is called from PAC1 after the FINISH card has been read. However, it will also be called from RECO for phase transition points. In this latter case, any

processing (the  $H_0^0$  calculation, the least-squares fit, or the punching of coefficients) will be for the species phase coming ahead of the transition point in the input. For example, for a species with input data for the solid followed by the liquid, DELH will process the solid when it has been called from RECO. The liquid will be processed when DELH is called from PAC1.

TABLES(C540 to C570). - This routine lists tables of thermodynamic functions as discussed in appendix E. The output format varies depending on the availability of the following values: (1) the  $H_{298.15}^0 - H_0^0$  value which is required in obtaining  $H_T^0 - H_{298.15}^0$  and  $-(F_T^0 - H_{298.15}^0)$ , and (2) the  $H_0^0$  value which is required in obtaining  $H_T^0$  and  $-F_T^0$ .

LOGK(C580 to C650). - This routine is called only if a LOGK option card has been included in the input. It calculates  $\Delta H_T^0/RT$ ,  $\Delta H_T^0$ ,  $-\Delta F_T^0/RT$ , and log K for the formation of the species from the assigned reference elements and the monatomic gases. The required enthalpy and free-energy data for these reactants have been stored on tape by the EFTAPE subroutine.

The LOGK routine lists two tables of properties as detailed in appendix E. If any reactant species for either of the formation reactions is not on tape, the appropriate columns in these tables are left blank.

LEAST(C660 to C760). - This routine is called from DELH only if one or more LSTSQS cards have been included in the input. It calculates the least-squares coefficients, lists certain information detailed in appendix E, and calls PUNCH to punch the coefficients on cards.

PUNCH(C770 to C790). - This routine punches binary cards containing the coefficients obtained either from a least-squares fit or from the DATA cards associated with method COEF. For these two options, PUNCH is called from subroutines LEAST and DELH, respectively.

The contents of each card are listed in the order they are punched. See output details in appendix E.

## APPENDIX A

### SYMBOLS

$A_e, B_e, C_e$	rotational constants corresponding to equilibrium separation of atoms
$A_0, B_0, C_0$	rotational constants for lowest vibrational state
$a_i$	polynomial coefficients used in eqs. (10) to (12)
$a_{r+1}$	integration constant defined by eq. (11)
$a_{r+2}$	integration constant defined by eq. (12)
$b$	constant defined in eq. (8)
$C_p^0$	heat capacity at constant pressure for standard state
$c$	velocity of light or crystal phase of chemical substance
$c_2$	second radiation constant, $hc/k$
$D, D_e$	spectroscopic constants for rotational stretching
$D_0, D_{000}$	rotational stretching constants for lowest vibrational state
$D_T^0$	dissociation energy at temperature $T$ for standard state
$d_i$	degeneracy associated with $\nu_i$
$F_T^0$	$(F_T^0 - H_0^0) + H_0^0$
$F_T^0 - H_0^0$	sensible free energy at temperature $T$ relative to $0^\circ K$ for standard state
$F_T^0 - H_{298.15}^0$	sensible free energy at temperature $T$ relative to $298.15^\circ K$ for standard state
$g_i, g_m$	electronic statistical weight
$g_{ii}$	anharmonicity constant for doubly degenerate vibrations in linear molecules
$H_0^0$	chemical energy at $0^\circ K$ for standard state
$H_T^0$	$(H_T^0 - H_0^0) + H_0^0$
$H_T^0 - H_0^0$	sensible enthalpy at temperature $T$ relative to $0^\circ K$ for standard state
$H_T^0 - H_{298.15}^0$	sensible enthalpy at temperature $T$ relative to $298.15^\circ K$ for standard state
$h$	Planck's constant

$I_A, I_B, I_C$	principal moments of inertia
$J_i, J_m$	total angular momentum quantum number
K	equilibrium constant
k	Boltzmann constant
L	total number of electronic energy states
$l$	liquid phase of chemical substance
M	molecular weight
$N_0$	Avogadro's constant
n	number of unique frequencies or principal quantum number
p	partial pressure
Q	internal partition function
$Q^m$	internal partition function for $m^{\text{th}}$ electronic state
$Q_c^m$	correction factor to the partition function for anharmonicity and vibration-rotation interaction for $m^{\text{th}}$ electronic state
$Q_e^m$	electronic partition function for $m^{\text{th}}$ electronic state
$Q_R^m$	classical-rotation partition function for $m^{\text{th}}$ electronic state
$Q_V^m$	harmonic-oscillator partition function for $m^{\text{th}}$ electronic state
$Q_W^m$	Fermi resonance correction factor to partition function for $m^{\text{th}}$ electronic state
$Q_\rho^m$	low temperature rotational correction factor to partition function for $m^{\text{th}}$ electronic state
$Q_\theta^m$	rotational-stretching correction factor to partition function for $m^{\text{th}}$ electronic state
$q_i$	temperature exponents in eq. (10)
R	universal gas constant
r	number of coefficients $a_i$ in eq. (10)
$S_c$	constant defined by eq. (5)
$S_T^0$	entropy for standard state
T	temperature, $^{\circ}\text{K}$
$T_0$	electronic excitation energy between lowest vibrational states ( $v = 0$ ) of ground and excited state for diatomic and polyatomic gases

$u_i$	$c_2 \nu_i / T$
$v, v_i$	vibrational quantum number
$W_0$	Fermi resonance constant
$x_{ij}, y_{ijk}$	anharmonicity constants for polyatomic molecules
$\alpha_e, \alpha_i$	vibration-rotation interaction constants for diatomic and linear polyatomic molecules
$\alpha_i^A, \alpha_i^B, \alpha_i^C, \alpha_{ij}$	vibration-rotation interaction constants for polyatomic molecules
$\beta_i$	rotational-stretching - vibration interaction constant
$\epsilon_m$	energy of $m^{\text{th}}$ electronic state
$\nu_i$	observed fundamental frequency
$\rho$	rotational-stretching spectroscopic constant
$\sigma$	symmetry number
$\omega_e$	zero-order vibrational frequency for diatomic molecule
$\omega_e^{x_e}, \omega_e^{y_e}, \omega_e^{z_e}$	anharmonicity constants for diatomic molecules

## APPENDIX C

### MAP ROUTINES (DESCRIPTION AND LISTING)

#### SKFILE(N, M)

This routine causes M end-of-file marks to be skipped over on tape unit N. This routine is called for in the FORTRAN program sections C90, C530, and C590; it is as follows:

```

**BCDUMP(A, B)**

This routine causes data to be punched out in absolute binary cards (up to 22 words per card). The arguments A and B are the first and last words to be dumped, respectively. The routine is called for in the FORTRAN program sections C100 and C790; it is as follows:

SIBLDR BCDUMP		STEXT BCDUMP		ENTRY BCDUMP		
<b>BINARY CARD (NOT PUNCHED)</b>

## BCREAD(A, B)

This routine causes absolute binary data cards as punched by the BCDUMP routine described previously to be read. Arguments A and B are first and last storage locations of the data being read. The routine is called for in the FORTRAN program section C110 and is as follows:

				ENTRY		BCREAD		
<b>BINARY CARD (NOT PUNCHED)</b>

## APPENDIX D

### DETAILS IN PREPARING INPUT

#### Uniform Format

Except for binary EF data cards, all input cards are read in with a uniform format, namely A6, 4(A6, F12.0), I2. The sections of the card will be referred to as follows:

	Label 1	Numerical value 1	Label 2	Numerical value 2	Label 3	Numerical value 3	Label 4	Numerical value 4		
Card columns	1 to 6	7 to 12	13 to 24	25 to 30	31 to 42	43 to 48	49 to 60	61 to 66	67 to 78	79 to 80
Format	A6	A6	F12.0	A6	F12.0	A6	F12.0	A6	F12.0	I2

The labels (label 1, label 2, . . .) are codes on all types of input cards except one. (The exception, described in the section Data cards for FIXEDN, ALLN, or TEMPER methods, is the card containing spectroscopic data for atoms). These codes serve two purposes. One purpose is to specify an option in the program. For example, the label RRHO specifies a method of calculation. The second purpose is to identify the number which follows it. For example, the label R on the CONSTS card precedes the numerical value of the universal gas constant.

The last two columns (79 and 80) are used only with molecular constant data. For atomic gases, the principal quantum numbers are punched in these columns if needed with the method being specified. For diatomic and polyatomic gases, the electronic level identification is punched in these columns if excited states are included.

Some general rules in keypunching the input cards are given as follows:

- (1) With one exception, card columns 1 to 6 and labels are alphanumeric and must be left-adjusted. The exception is that the labels on the DATA cards which contain spectroscopic constants for monatomic gases are numbers and do not need to be left-adjusted. (See DATA cards.)
- (2) All blank labels are ignored by the program.
- (3) For the specific data, each numerical value must be immediately preceded by its label. However, the order of values is usually immaterial. Exceptions are noted in the details for the individual cards.
- (4) The numerical values may be the following:
  - (a) A right-adjusted integer
  - (b) A floating-point number without exponent (e.g., 0.00021), anywhere in the field

- (c) A right-adjusted floating-point number with exponent indicating decimal place (e.g.,  $2.1\text{-}4$  is  $2.1 \times 10^{-4}$ )
- (5) The last two columns (79 and 80) are right-adjusted integers.

## Order of Input Cards

Some discussion on the order of the input cards is given in the section General Flow of the Program. Specific instructions for placement of the individual cards are given in the details for making up the cards.

Ordinarily the general data cards should precede the specific data cards. However, general data cards may be inserted after the specific data for one or more species. The information on these cards, however, will be available only for the calculations called for by specific data which follow it. If a second CONST card, ATOM card for a particular atom, or set of EFDATA and binary EF data cards for a particular reactant is inserted, the data on the second card(s) are used for the succeeding calculations.

Otherwise, the general data may be read in any order as long as the EF DATA and binary EF data cards remain in an ordered set for each reactant, namely EF DATA card followed by binary EF data cards as numbered in card columns 79 to 80.

For a single computer run, there may be any number of species processed where each species requires its own set of specific data. The set of specific data cards for each species should be in the following order:

- (1) Formula card
  - (2) Optional cards (REFNCE, EFTAPE, LOGK, LSTSQS, INTERM, or DATE) in any order
  - (3) TEMP card(s), if any
  - (4) METHOD card
  - (5) DATA card(s)
  - (6) FINISH card
- There may be more than one set of these cards for a single species.

## General Data Cards

Examples of the individual cards discussed in this section are given in appendix F. CONSTS card. - This card, which contains physical constants, is not optional. An example of the necessary labels and one possible set of numerical values is as follows:

Label	Description	Value (ref. 3)
HCK	hc/k, second radiation constant	1.4388
R	Universal gas constant	1.98726
SCONST	Entropy constant $S_c$ (see eqs. (4) and (5))	3.66511

A more recent set of physical constants is given in reference 35.

ATOM cards. - The order of the labels and information on each of these cards must be as follows:

Card section	Contents
Columns 1 to 6	ATOM
Label 1	Left-adjusted atomic symbol, for example, H, HE, LI
Numerical value 1	Atomic weight
Label 2	Left-adjusted formula of assigned reference element. The formula must give the atomic symbol, the number of atoms (even if just one), a left parenthesis, G or S depending on whether the elemental form is gas or solid, respectively, and finally a right parenthesis. Examples: P1(S), O2(G), LI1(S)
Numerical value 2	Coefficient, b, in equation (8)
Numerical value 3	Sum of the statistical weights $\sum g_i$ (eq. (8)) for the ground electronic state

Numerical values 2 and 3 are needed only with the FILL option on the METHOD card for monatomic gases. These values were included for Mg(g) in example 5 in appendix F.

EFDATA and binary EF data cards. - A set of these cards contains enthalpy and free energy data for either a monatomic gas or an assigned reference element. The data will be put on FORTRAN tape number 3 and used for  $\Delta H_T^0$  and log K calculations. There may be any number of sets, or none, of these cards in the general data. These cards are not keypunched, but rather are part of the punched card output of a previous run. In order to obtain these punched cards, the previous run required an EFTAPE option card in the species input data for either an assigned reference element or a monatomic gas. For example, a set of these cards were punched in example 2, appendix F, for F<sub>2</sub>(g) and used as input in example 3.

LISTEF card. - The LISTEF card is optional and contains the card columns 1 to 6 code only. The data on any binary EF data cards which follow the LISTEF card will be listed. The binary EF data cards for each reactant must still be immediately preceded by an EFDATA card. (See example 5 in appendix F.)

### Specific Input Cards

Examples of the individual cards discussed in this section are given in appendix F.

Formula card. - This card is the first card for each species and is reserved for two pieces of information. First, the species formula, as detailed below, is always

required. Second, either an assigned enthalpy or a heat of reaction value with the corresponding units and temperature is required only when calling for either of the following two options:

- (1) log K and  $\Delta H$  calculations, or
- (2) Least-squares fit of the thermodynamic functions

The first 12 columns are reserved for the formula of the species. Even when the formula takes less than 7 columns, columns 7 to 12 (label 1) should never be used for any code as is done on other types of cards. The formula should be left-adjusted and contain no blanks. It should be punched in the following order:

- (1) Each atomic symbol followed by the number of atoms even if the number is 1; these atomic symbols should correspond to the symbols on the ATOM card in the general input
- (2) For ionic species, the proper number of pluses or minuses should be punched
- (3) A left parenthesis
- (4) A G for a gas, an L for a liquid, or an S for solid
- (5) A right parenthesis

The following are examples for ionized species:

Species	Columns 1 to 12
F <sup>-</sup>	F1-(G)
N <sup>+</sup>	N1+(G)
O <sup>++</sup>	O1++(G)
O <sub>2</sub> <sup>-</sup>	O2-(G)

The remainder of the card is reserved for a heat of reaction, the energy units for the reaction, and the temperature of the reaction. There are five forms in which the heat of reaction may be expressed and five choices of units. These are summarized in table IV.

REFNCE card. - The only purpose of this card is to identify sources of input data. The labels and numerical values are arbitrary. (See MgO(g) in example 5, appendix F.)

EFTAPE card. - This option card is used either with an atomic gas or an assigned reference element whose data are needed for succeeding  $\Delta H_T^0$  and log K calculations. The card has only the letters EFTAPE punched in card columns 1 to 6. Inclusion of the card causes the  $H_0^0$  and the  $(H_T^0 - H_0^0)/RT$  and  $-(F_T^0 - H_0^0)/RT$  data for this species to be (1) put on the end of FORTRAN tape 3 where they are available for use with succeeding calculations during the same computer run and (2) punched on cards to be included with other general data during future computer runs. (See example 2 and Mg(g) in example 5, appendix F.)

LOGK card. - Inclusion of this option card causes tables of thermodynamic prop-

erties including  $\log K$  and  $\Delta H$  to be listed. It simply has the code **LOGK** punched in card columns 1 to 4. The  $\log K$  and  $\Delta H$  calculations will be for reactions involving either the assigned reference elements or the monatomic gases or both depending on what data are available on FORTRAN tape 3. If there is no matching temperature in the appropriate atomic gas or assigned reference element data on FORTRAN tape 3, the data that are there will be interpolated by three-point Lagrangian interpolation. (See example 3 and Mg(s) in example 5, appendix F.)

**LSTSQS card(s).** - Inclusion of one or more of these cards calls for a least-squares fit of the functions to equations (10) to (12) as discussed in the section on Least-squares fit. The LSTSQS card(s) may contain three possible labels, T, EXP, and TCONST, and their corresponding values. In table V, desired temperature intervals are given by using T labels, and exponents ( $q_i$  in eqs. (10) to (12)) are given by using EXP labels. The fit will be constrained in two ways, (1) to fit the data at one temperature which must be an endpoint of an interval (TCONST label) and (2) to give equal values of the thermodynamic functions at common endpoints of the intervals. The numerical values associated with the T and TCONST codes must be equal to some temperature in the temperature schedule for the thermodynamic functions. (See Mg(g) in example 5, appendix F.)

If any of the three possible labels are omitted on the LSTSQS card(s), values will be assigned by the program. If no TCONST is given, it will be assigned to be either  $1000^{\circ}$  K or, if a phase transition takes place, the temperature of transition (each phase will be fitted separately). If no EXP is given, the  $q_i$  values will be assigned to be 0, 1, 2, 3, and 4. If no T's are given, the temperature intervals will be assigned to be  $300^{\circ}$  to  $1000^{\circ}$  K and  $1000^{\circ}$  to  $5000^{\circ}$  K. (See example 4, appendix F.)

**INTERM card.** - This card calls for intermediate output to be printed out when thermodynamic functions are being calculated from molecular constants. (See  $H_2O(g)$  in example 5, appendix F.)

**DATE card.** - The purpose of the DATE card is to punch a date or code on the binary least squares coefficient cards. The card should contain only one label which will be punched as the last word on the last least squares coefficient card punched for each species. (See Mg(g) in example 5, appendix F.)

**TEMP card(s).** - These cards give a temperature schedule for which thermodynamic functions are to be calculated. The program allows for a maximum of 201 temperatures per species.

Each temperature in the desired temperature schedule may be specified individually with a T label. (See table V.) However, if there are several temperatures incremented by a fixed amount, this part of the temperature schedule may be specified by punching in order: the lowest temperature labeled T, the increment labeled I, and the highest temperature labeled T. For example, the temperature schedule, 100, 200,

298.15, 300, 400, 500, 600, 688.2, 700, 750, 800, 850, 900, 962.3, and 1000, could be keypunched as follows:

Card columns 1 to 6	Label 1	Numerical value 1	Label 2	Numerical value 2	Label 3	Numerical value 3	Label 4	Numerical value 4
TEMP T		100.	I	100.	T	600.	T	688.2
TEMP T		700.	I	50.	T	900.	T	962.3
TEMP T		1000.						

The temperature,  $298.15^{\circ}\text{K}$ , is always inserted in the temperature schedule when there are temperature values below and above  $298.15^{\circ}\text{K}$ . (See examples 1 and 3, and Ar(g),  $\text{H}_2\text{O}(g)$ , Mg(s), and MgO(g) in example 5, appendix F.)

If there are no TEMP cards in a set of data where the thermodynamic functions are to be calculated, the program (section C40) assumes the standard temperature schedule used in reference 3, namely, every  $100^{\circ}$  from  $100^{\circ}$  to  $6000^{\circ}\text{K}$  with  $298.15^{\circ}$  inserted between  $200^{\circ}$  and  $300^{\circ}\text{K}$ . (See example 2 and Mg(g) in example 5, appendix F.)

The only option for which TEMP cards must not be used is READIN (see METHOD card). For this option, the temperatures are read in on DATA cards together with the thermodynamic functions to which they correspond. (See example 4 and Mg(s) in example 5, appendix F.)

METHOD card. - This card follows the option cards and must be included for any calculations to take place. It specifies the technique for obtaining the thermodynamic functions (see section Options) and immediately precedes the data required by the method (DATA cards). The card has the code word METHOD in card columns 1 to 6. The possible codes in the label and numerical value columns are summarized in table VI. The functions may be (1) calculated from molecular constants for ideal gases (labels FIXEDN, ALLN, or TEMPER for monatomic molecules and labels RRHO, PANDK, JANAF, NRRHO1, or NRRHO2 for diatomic and polyatomic molecules) (see examples 1 to 3 and  $\text{H}_2\text{O}(g)$ , Mg(g), and MgO(g) in example 5, appendix F), (2) calculated from coefficients and exponents using equations (10) to (12) (label COEF), (see Ar(g) and Mg(l) in example 5, appendix F), or (3) read in directly (label READIN) (see example 4 and Mg(s) in example 5, appendix F). These calculation techniques are discussed in the section CALCULATION OF IDEAL GAS THERMODYNAMIC FUNCTIONS.

In conjunction with these method codes, the METHOD card may contain some additional codes and information as indicated in table VI.

Occasionally, a single method may not apply to the entire desired temperature range for a species. In this case the following cards must be included for each temperature

interval, in order: (1) TEMP card(s) for the desired temperature interval (if the method is not READIN), (2) a METHOD card for this temperature interval, and (3) the associated DATA cards. The sets should be in order of increasing temperature. (See Mg(s,  $\ell$ ) in example 5, appendix F.)

DATA cards. - These cards follow the METHOD card and contain the input data required by the method. Except for the spectroscopic data of monatomic gases (see example 2 and Mg(g) in example 5, appendix F), the labels are codes identifying the numerical values that follow them. Table VII is a summary of the labels and numerical values to be used on DATA cards for the various methods given in table VI. A further description of the DATA cards for the various methods follows:

DATA cards for READIN method: Each card must contain four labels with the four corresponding numerical values as indicated in table VII. The four labels correspond to temperature, heat capacity, enthalpy, and either entropy or free energy. Temperature always has the label T; however, the other three have several options as given in table VII depending on the data to which they correspond. If enthalpy and free energy are referred to  $H_{298.15}^0$  rather than  $H_0^0$ , the  $H_{298.15}^0 - H_0^0$  value must be included on the METHOD card (label H298H0) if  $H_T^0 - H_0^0$  values are desired in the final tables. (See example 4 and Mg(s) in example 5, appendix F.)

DATA cards for COEF method: The coefficient and exponent values for each set of empirical equations (eqs. (10) to (12)) must be preceded by the values of the temperature limits (T labels in table VII) for which the equation applies (see Ar(g) and Mg(s) in example 5, appendix F). The lower T value must be the first numerical value.

Occasionally, the coefficients  $a_i$  ( $i = 1, r$ ) are available while the integration constants for enthalpy and entropy  $a_{r+1}$  and  $a_{r+2}$  are not. For this case,  $a_{r+1}$  and  $a_{r+2}$  values may be calculated by the program in one of the following ways:

(1) Reading in an enthalpy and an entropy or free energy value with the corresponding temperature on the first card. The labels and values should be the same as for the DATA cards for the READIN method except that  $C_p^0$  or  $C_p^0/R$  may be omitted.

(2) Using the value of enthalpy or entropy of transition (DELTAH or DELTAS on the METHOD card (see table VI)). This method may be used only when the two phases related by the transition value are being processed in the same run. The reason is that the transition value is combined with the enthalpy or entropy value for the last temperature of the preceding phase. (See Mg(s,  $\ell$ ) in example 5, appendix F.)

With COEF method there is an option to punch these coefficients on binary cards in the form required for use with the IBM program described in reference 33. (With LSTSQS option, similar binary cards are always made and are not optional.) For each set of coefficients the temperature intervals to be punched are indicated with TPUNCH

labels and corresponding values which give the endpoints of the intervals. These TPUNCH values may or may not be the same as the T values for the set. For reference 33, coefficients for two temperature intervals are required. In the event there is only one set of coefficients available, the same set can be used in two intervals by using three TPUNCH values. (See Ar(g) in example 5, appendix F.)

**DATA cards for FIXEDN, ALLN, or TEMPER methods:** In contrast to all other types of cards using the universal format, these cards use the label columns as well as the numerical columns for numbers. The labels contain the total angular momentum quantum number  $J_m$  (eq. (7), and the numerical values contain the excitation energy  $\epsilon_m/hc$  (eq. (7)) in centimeters<sup>-1</sup>. For either the FILL option or the FIXEDN method, the principal quantum numbers must be punched in card columns 79 to 80, right-adjusted. The data on the remaining portion of the card must correspond to that principal quantum number.

**DATA cards for RRHO, PANDK, JANAF, NRRHO1, or NRRHO2 methods:** The equations for the partition function of the various methods are given in tables I and II. The input data must always contain at least the following quantities for each electronic state:

- (1) The fundamental vibrational frequencies of the molecule ( $\omega_e$  or  $\nu_i$ )
- (2) Either the rotational constant(s) ( $B_0$  for linear;  $A_0$ ,  $B_0$ , and  $C_0$  for nonlinear molecules) or the moment(s) of inertia ( $I_B$  for linear;  $I_A$ ,  $I_B$ , and  $I_C$  for nonlinear molecules)
- (3) The symmetry number
- (4) The statistical weight

Other spectroscopic constants such as anharmonicity or rotation-vibration interaction constants are optional. If these optional constants are not included, correction terms involving them are automatically excluded from the partition function. (See example 1 (RRHO), example 3 (PANDK), and H<sub>2</sub>O(g) (NRRAO2) and MgO(g) (PANDK) in example 5, appendix F.).

When excited electronic states are involved, the data for each state are read and processed separately. Therefore, the data cards must be grouped together with an identifying number in card columns 79 to 80. For example, the data for the three electronic states included for MgO(g) in example 5, appendix F, are distinguished by 1, 2, or 3 punches in card column 80.

**FINISH card.** - This card is the last card in the specific input cards for each species. It contains only the code in card columns 1 to 6.

## APPENDIX E

### DETAILS IN OUTPUT

#### Punched Cards

Certain options in the specific data cause cards to be punched. A description of these punched cards follows.

EFDATA and binary EF data. - A set of EFDATA and binary EF data cards is punched when an EFTAPE card has been included in the specific data for either an assigned reference element or a monatomic gas.

The first card is the EFDATA card and is punched in the uniform format. It contains the formula, the  $H_0^O$  value, the melting point, and the number of temperatures for which enthalpy and free energy data are available on succeeding binary cards.

The remaining cards are binary EF data cards and are punched in column binary. Each binary card contains the chemical formula and seven temperatures with corresponding  $(H_T^O - H_0^O)/RT$  and  $-(F_T^O - F_0^O)/RT$  values (except possibly the last card which may have seven or less).

These cards are punched so that they may be used as general input for subsequent computer runs and be available for  $\Delta H_T^O$  and log K calculations. (See the general input in examples 3 and 5 in appendix F.)

Coefficients for empirical equations. - Coefficients for empirical equations (eqs. (10) to (12)) will be punched on column binary cards if one of the following is true:

(1) A LSTSQS option card is included in the specific data for a particular species. The coefficients are obtained from a least-squares fit of the functions.

(2) Predetermined coefficients are read in directly (method COEF), and TPUNCH codes are on the DATA cards.

The format used for punching these coefficient cards was selected to be consistent with that used in reference 33. The following information is punched on these cards:

- (1) The formula of the species as given on the formula card
- (2) The ionization potential if there is one
- (3) The entire temperature range
- (4) The temperature ranges of the intervals
- (5) Seven coefficients ( $a_1, \dots, a_5$  in eq. (10),  $a_{r+1}$  in eq. (11), and  $a_{r+2}$  in eq. (12)); if there are fewer than 5 coefficients in equation (10), zeros will be inserted but if there are more than 5 coefficients, only the first 5 will be punched

Note the exponents ( $q_i$  in eqs. (10) to (12)) are not punched. However, they are listed together with the  $a_i$  following the intermediate data associated with the least-squares fit for each temperature interval. (See output listings for example 4 and Mg(g)

in example 5, appendix F.) For reference 33,  $q_1 = 0$ ,  $q_2 = 1$ , . . . ,  $q_5 = 4$ .

There are 24 binary words on a card. Table VIII shows the contents of these cards for up to the nine interval limit. Only as much data are punched as required by the temperature intervals. The temperature intervals are the values following T labels on the LSTSQS cards or TPUNCH labels on the DATA cards following a METHOD COEF card. When no T labels are punched on the LSTSQS card(s), two intervals are assumed,  $T = 300^{\circ}$  to  $T = 1000^{\circ}$  K and  $T = 1000^{\circ}$  to  $T = 5000^{\circ}$  K. The contents of these cards are listed as they are punched. (See output listings for examples 4 and Ar(g) and Mg(g) in example 5, appendix F.)

### Listed Output

Input data cards in the uniform format as well as tables of thermodynamic functions resulting from each set of specific data are always listed. Other data will be listed with certain options.

Input data. - All input data cards in the uniform format are listed immediately after they are read. The output format is similar to the uniform input format with spacing between the labels and values. Numerical values which are zero are left blank. (See examples in appendix F.)

The data on the binary EF data cards which are read in as input will be listed only when an LISTEF card precedes the EFDATA card somewhere in the deck. (See the general input and output data in example 5, appendix F; only the O<sub>2</sub> data are listed.)

Punched card output. - The contents of all cards punched by the program will be listed except for the binary EF data cards. For this latter case, the punched data will be listed only when a LISTEF card precedes the specific data somewhere in the deck. In example 3, appendix F, the punched binary EF data are not listed while for Mg(g) in example 5, they are. This is because of the LISTEF card in the general data of example 5.

Tables of thermodynamic properties. - Two tables of thermodynamic functions are always listed with each set of specific data. These tables are the following:

(1) Table of dimensionless properties as follows:

$T$ ,  $C_p^0/R$ ,  $(H_T^0 - H_0^0)/RT$ ,  $(H_T^0 - H_{298.15}^0)/RT$  (if  $T = 298.15$  is in T range),  
 $S_T^0/R$ ,  $-(F_T^0 - H_0^0)/RT$ ,  $-(F_T^0 - H_{298.15}^0)/RT$  (if  $T = 298.15$  is in T range),  
 $H_T^0/RT$  (if an  $H_0^0$  value is available), and  $-F_T^0/RT$  (if an  $H_0^0$  value is available)

(2) Table of dimensioned properties as follows:

$T$ ,  $C_p^0$ ,  $H_T^0 - H_0^0$ ,  $H_T^0 - H_{298.15}^0$  (if  $T = 298.15$  is in  $T$  range),  $S_T^0$ ,  $-(F_T^0 - H_0^0)$ ,  $-(F_T^0 - H_{298.15}^0)$  (if  $T = 298.15$  is in  $T$  range),  $H_T^0$  (if an  $H_0^0$  value is available) and  $-F_T^0$  (if an  $H_0^0$  value is available)

See output for the examples in appendix F.

When a LOG K option card is included in a set of specific data, two additional tables are listed for that particular species. (See example 3 and Mg(s) and MgO(g) in example 5, appendix F.) These two tables are the following:

(1) Table of dimensionless properties as follows:

$T$ ,  $C_p^0/R$ ,  $(H_T^0 - H_0^0)/RT$ ,  $S^0/R$ ,  $-(F_T^0 - H_0^0)/RT$ ,  $H_T^0/RT$ ,  $F_T^0/RT$ , and  $\Delta H_T^0/RT$  and  $-\Delta F_T^0/RT$  for reactions from the assigned reference elements, and  $\Delta H_T^0/RT$  and  $-\Delta F_T^0/RT$  for reactions from the monatomic gases

(2) Table of dimensional properties as follows:

$T$ ,  $C_p^0$ ,  $H_T^0 - H_0^0$ ,  $S_T^0$ ,  $-(F_T^0 - H_0^0)$ ,  $H_T^0$ , and  $\Delta H_T^0$  and  $\log_{10}K$  for formation from the assigned reference elements, and  $\Delta H_T^0$  and  $\log_{10}K$  for formation from monatomic gases

These tables will have an asterisk and a footnote indicating where a melting point has occurred in an assigned reference element. (See MgO(g) in example 5, appendix F.)

Least squares polynomial and errors. - A least-squares fit of the functions,  $C_p^0/R$ ,  $(H_T^0 - H_0^0)/RT$ , and  $S_T^0/R$ , results when LSTSQS card is included in a set of specific data. (See example 4 and Mg(g) in example 5, appendix F.)

For each temperature interval, the following information is listed:

(1) For each  $T$  within the interval,

(a)  $C_p^0/R$ ,  $(H_T^0 - H_0^0)/RT$ , and  $-(F_T^0 - H_0^0)/RT$

(b) Functions in (1a) as calculated from least-square coefficients and equations (10) to (12)

(c) Differences in (1a and b); these values are referred to as errors hereinafter

(d) Values in (1c) divided by original values in (1a); these values are referred to as relative errors hereinafter

(2) For errors in entire interval for each function in (1a):

(a) Maximum relative error (MAX REL ERR) and corresponding temperature - see (1d)

(b) Average relative error (AVER REL ERR) - see (1d)

(c) Root mean square of relative errors (REL LST SQ ERR) - see (1d)

(d) Maximum error (MAX ERR) and corresponding temperature - see (1c)

(e) Average error (AVER ERR) - see (1c)

(f) Root mean square of errors (LST SQ ERR) - see (1c)

(g)  $C_p^0/R$  equation (see eq. (10)) for coefficients  $a_i/R$

(h) Integration constants in equations (11) and (12) as follows:

$$(H - H_0)/R \text{ CONSTANT} = (a_{r+1} - H_0^0)/R$$

$$H/R(A6) \text{ CONSTANT} = a_{r+1}/R$$

$$S/R \text{ CONSTANT} = a_{r+2}/R$$

Finally, the contents of the punched binary coefficient cards are listed. See the section Punched card output.

Intermediate data with FILL option for monatomic gases. - Unobserved but predicted energy levels for monatomic gases will be included in the partition function (eq. (7)) if the FILL code is punched on the METHOD card. See the section Inclusion of predicted levels for the method of predicting the levels.

In Mg(g) in example 5, appendix F, the following data are listed in columns from left to right:

- (1) b value from ATOM card (see eq. (8))
- (2) Principal quantum number n
- (3)  $bn^2$  [predicted  $\sum(2J + 1)$ ]
- (4)  $\sum(2J + 1)$  from input data
- (5) Column (3) minus column (4)
- (6) Highest energy level for principal quantum number
- (7) Sum of column (5) and  $2J + 1$  for level of column (6)

Intermediate data with INTERM card. - Intermediate data are listed for ideal gas calculations if an INTERM card is included in the specific data for a particular species.

Monatomic gases: For monatomic gases several items are listed. The input data are listed in order of increasing energy level values. The data include, from left to right, values for the principal quantum number, J,  $2J + 1$ , and the energy level.

For each temperature, three lines of data are listed as follows:

- (1) A statement indicating where the energy levels were cut off; five possible statements are the following:

(a) NOT ALL LEVELS WERE USED. X IS GREATER THAN 85. - This statement indicates that not all atomic energy levels were used because  $\epsilon/kT > 85$  in equation (7).

(b) ALL LEVELS USED THROUGH N = (FIXEDN value) - This statement indicates all atomic levels were used through a fixed principal quantum number (method FIXEDN).

(c) ALL ASSIGNED LEVELS HAVE BEEN USED - This statement indicates all

atomic levels in input were used (method ALLN)

(d) NOT ALL ASSIGNED LEVELS WERE USED, Q AND DERIVATIVES ARE TOO SMALL - This statement indicates not all atomic levels were used because the following conditions occurred:

$$Q^m \leq 1 \times 10^{-10}$$

and

$$(\epsilon_m/kT)^2 Q^m \leq 1 \times 10^{-10}$$

when  $\epsilon_m/kT > 2$ .

(e) ALL LEVELS HAVE BEEN USED TO THE THERMAL BINDING ENERGY (lowered IP value). - This statement gives the lowered ionization potential value (i. e., ionization potential - Tk/hc) where levels have been cut off.

(2) Values of T,  $C_p^0/R$ ,  $(H_T^0 - H_0^0)/RT$ , and  $-(F_T^0 - H_0^0)/RT$

(3) Values of  $\epsilon/kT$ , Q,  $T dQ/dT$ ,  $T^2 d^2Q/dT^2 + 2T dQ/dT$  (eq. (7))

Diatom and polyatomic gases: Intermediate results are listed when an INTERM card is included with the specific input data cards for a diatomic or polyatomic gas and the method of calculation is RRHO, JANAF, PANDK, NRRAO1, or NRRAO2. These results include values for the formulas and variables defined in tables I and II. Although the molecular constants are always listed as they are punched on the DATA cards with an INTERM card, many of them are listed again.

The following data are listed (see tables I and II for definitions and  $H_2O(g)$  in example 5, appendix F):

- (1)  $A_0$ ,  $B_0$ ,  $C_0$ ,  $\rho$
- (2)  $a_i^A$ ,  $a_i^B$ ,  $a_i^C$  where  $i = 1$  to the number of unique frequencies
- (3)  $\theta_1$ ,  $\theta_2$ ,  $\theta_3$
- (4)  $y_{ijk}$
- (5)  $x_{ij}$
- (6) LEVEL = (value in card columns 79 to 80 which is used to identify the electronic levels)
- (7)  $\nu_i$ ,  $d_i$ ,  $g_{ii}$
- (8) T
- (9)  $u_i$ ,  $r_i$ ,  $s_i$ ,  $i$
- (10) As required by the method of calculation, values for the formulas in tables I and II are listed for Q,  $\ln Q$ ,  $T d(\ln Q)/dT$ , and  $T^2 d^2(\ln Q)/dT^2 +$

$2T \frac{d(\ln Q)}{dT}$ . The latter three values are additive contributions to  $-(F_T^0 - H_0^0)/RT$ ,  $(H_T^0 - H_0^0)/RT$ , and  $C_p^0/R$ , respectively, when only the ground electronic state is considered. These values are identified in the listing by codes which correspond to the formula numbers as follows:

Code on listing	Formula numbers in tables I and II
ELECTR	1
H.O.	2
R.R.	3 or 4
RHO	5

## APPENDIX F

### EXAMPLES

The punched card input and listed output are given for several sample problems. The first four examples are simple problems with minimal input. Each of these examples is for a particular species with only as much general data shown as required. These four problems may be run individually, or they may be run together in a single computer run. For this latter case, the general data may be combined. A listing of input cards is given with the combined general data of these first four species.

The fifth example includes specific input cards for five species and general input cards which accommodate a much larger variety of problems. It has, for example, ATOM cards for the first 20 elements. Such a set of ATOM cards may be considered a permanent part of the operating deck.

All input data are the same as the data used in reference 3. Format details for keypunching input cards are described in appendix D.

#### Example 1 ( $\text{MgF}_2(\text{g})$ with RRHO Method)

Problem. - Calculate the thermodynamic functions for  $\text{MgF}_2(\text{gas})$  from  $100^{\circ}$  to  $500^{\circ}$  K at  $100^{\circ}$  intervals assuming a rigid-rotator harmonic-oscillator approximation and using the following data:

- (1) Physical constants:  $hc/k = 1.4388$  (centimeters)(degrees),  $R = 1.98726$  calories per mole per  $^{\circ}\text{K}$ , and  $S_C = -3.66511$  calories per mole per  $^{\circ}\text{K}$
- (2) Atomic weights:  $\text{F} = 19.00$  grams per mole and  $\text{Mg} = 24.32$  grams per mole
- (3) Molecular constants: statistical weight = 1,  $\nu_1 = 540 \text{ centimeter}^{-1}$ ,  $\nu_2 = 500(2) \text{ centimeter}^{-1}$ ,  $\nu_3 = 820 \text{ centimeter}^{-1}$ ,  $I_B = 19.77 \times 10^{-39}$  (grams)(centimeters) $^2$ , and symmetry number = 2

Punched card input. - The punched card input is as follows:

### Example 2 ( $F_2(g)$ with PANDK Method and EFTAPE Option)

Problem. - Calculate the thermodynamic functions for the reference element,  $F_2(g)$ , where the standard temperature schedule is assumed. Prepare a set of EF DATA and binary EF data cards for future  $\Delta H_f^0$  and log K calculations. Use the PANDK method and the following data:

- (1) Physical constants and atomic weights: Same as for example 1
- (2) Heat of formation:  $\Delta H_f^0(298.15^\circ\text{K})$  (assigned enthalpy at  $298.15^\circ\text{K}$ ) = 0
- (3) Molecular constants: statistical weight = 1,  $\omega_e = 923 \text{ centimeter}^{-1}$ ,  $\omega_e^x = 15.6 \text{ centimeter}^{-1}$ ,  $B_e = 0.8909 \text{ centimeter}^{-1}$ ,  $\alpha_e = 0.0162 \text{ centimeter}^{-1}$ , and symmetry number = 2

Punched card input. - The punched card input is as follows:

F2(G)

F2(G)

### Example 3 (F(g) with LOGK Option)

Problem. - In addition to calculating thermodynamic functions, calculate the heat of formation and equilibrium constant values for F<sub>2</sub>(g) from F<sub>2</sub>(g) for the temperatures, 298.15°, 1000°, 2156°, 3000°, and 5000° K. Use the enthalpy and free energy values for F<sub>2</sub> calculated in example 2 (i.e., the EFDATA and binary EF data cards for F<sub>2</sub>). For F(g), use the following data:

- (1) Physical constants and atomic weight: same as example 1
- (2) Heat of formation: ΔH<sub>f</sub><sup>0</sup>(298.15) = 18 858.2 calories per mole
- (3) Spectroscopic data: J<sub>1</sub> = 3/2, ε<sub>1</sub> = 0 and J<sub>2</sub> = 1/2, ε<sub>2</sub>/hc = 404.1 centimeter<sup>-1</sup>

Punched card input. - The punched card input is as follows:

Card columns 1 to 6	Label 1	Numerical value 1	Label 2	Numerical value 2	Label 3	Numerical value 3	Label 4	Numerical value 4	Card columns 79 to 80

#### Example 4 (P(s) with Least-Squares Fit)

Problem. - Use the data for P(solid) given in reference 3 to calculate the least-squares coefficients and punch them on cards as required for use with the program described in reference 33. Use functional form given in equations (10) to (12) with  $q_i = 1, 2, 3, 4$ , and 5. The data are normally fitted in two temperature intervals,  $300^{\circ}$  to  $1000^{\circ}$  K and  $1000^{\circ}$  to  $5000^{\circ}$  K. However, since P(solid) melts at  $317.3^{\circ}$  K, there will be only one set of coefficients for this case.

Punched card input. - The punched card input is as follows:

Card col- umns 1 to 6	Label 1	Numerical value 1	Label 2	Numerical value 2	Label 3	Numerical value 3	Label 4	Numerical value 4

### Example 5 (Ar(g), H<sub>2</sub>O(g), Mg(g), Mg(s, l), and MgO(g))

Description of problems. - This example is a combination of several problems. The input includes a more complete set of general input data and specific data for five species, Ar(g), H<sub>2</sub>O(g), Mg(g), Mg(s, l), and MgO(g).

The general data include ATOM cards for the first 20 elements. For simplicity, however, only five sets of EFDATA and binary EF data were included for three assigned reference elements and two monatomic gases, namely, Mg(s, l), H<sub>2</sub>(g), O<sub>2</sub>(g), H(g), and O(g). A LISTEF card is inserted before the O<sub>2</sub> EFDATA, and so the data on the binary EF data cards for O<sub>2</sub> will be listed in the output.

The specific input data cards are for solving the following problems:

(1) Ar(g) - Calculate thermodynamic functions from the following empirical equations (method COEF): C<sub>p</sub><sup>0</sup>/R = 2.5, (H<sub>T</sub><sup>0</sup> - H<sub>0</sub><sup>0</sup>)/RT = 2.5, and S<sub>T</sub><sup>0</sup>/R = 2.5 ln T + 4.3661076. Punch these coefficients for use with reference 33. Assume H<sub>298.15</sub><sup>0</sup> = ΔH<sub>f</sub><sup>0</sup>(298.15) = 0.

(2) H<sub>2</sub>O(g) - Calculate the thermodynamic functions for T = 5000° K using the NRRAO2 method. List intermediate results. Use H<sub>0</sub><sup>0</sup> = 57 103.5 calories per mole.

(3) Mg(g) - Perform the following options in the calculations:

(a) Calculate the thermodynamic functions using the lowered ionization potential cutoff technique (method TEMPER).

- (b) Include unobserved but predicted electronic levels (**FILL** option).
- (c) Include option for punching **EFDATA** and binary EF data cards and putting data on tape (**EFTAPE** card).
- (d) Do a least-squares fit of the functions from  $1000^{\circ}$  to  $5000^{\circ}$  K assuming the following  $C_p^0$  equation:  $a_1 + a_2 T + a_3 T^2 + a_4 T^3$ . Constrain the curve fit to fit the functions exactly at  $1000^{\circ}$  K.
- (e) Include **DATE** cards so 4/63 will be punched on coefficient cards.
- (4) **Mg(s, l)** - Perform the following options in the calculations:
- Calculate  $\Delta H_T^0$  and log K, and tabulate the values with the thermodynamic functions (**LOGK** card).
  - Read in data directly for the solid. (Note that **DATA** cards have several examples of various possible labels as given in table VIII.)
  - Assume  $C_p^0 = 8$  calories per mole per  $^{\circ}$ K for the liquid.
  - Calculate the integration constants (eqs. (11) and (12)) using a heat of melting value of 2140 calories at the melting point,  $923^{\circ}$  K.
- (5) **MgO(g)** - Calculate thermodynamic functions using **PANDK** method and including two excited electronic states. (Note that columns 79 to 80 identify to which of the three states the data belong). Calculate and list tables which include  $\Delta H_T^0$  and log K values. Use a disssociation energy of 90 kilocalories per mole at  $0^{\circ}$  K.

Punched card input. - The punched card input is as follows:

 $= \sum_j \ln Q_{c_j} \left[ \sum_i m_i u_{h_i}^2 r_{h_i} s_{h_i} (r_{h_i} s_{h_i} + 1) - 2S_j + S_j^2 - p_j \right]$  where  $\ln Q_c^m = \sum_j \ln Q_{c_j}$  and  $\ln Q_{c_j}$  is any term in formulas 8 to 27 which has the formula  $\ln Q_{c_j} = (c_2/T)^{p_j} C_j \prod_i r_{h_i}^{n_i} s_{h_i}^{m_i}$  where  $p_j = 0, 1, \text{ or } 2$ ;  $C_j$  is a constant;  $n_i$  and  $m_i$  are integer exponents; and  $h_i$  is an integer subscript, and where  $S_j = \sum_i u_{h_i} (n_i + m_i r_{h_i} s_{h_i}) - p_j$ .

TABLE III. - BRIEF DESCRIPTION OF CONTENTS OF INPUT CARDS

Type of card	Contents	Is card optional?
General data		
CONSTS	Physical constants, hc/k, R, and $S_c$ (eqs. (4) and (5))	No
ATOM	Chemical symbol, atomic weight, and reference form of each element. (If FILL option is used, also include the coefficient b in equation (8) and $\sum g_i$ in equation (8) for the ground state).	No
LISTEF	Code in card columns 1 to 6 only which calls for listing the contents of the binary EF data cards that are processed after the LISTEF card	Yes
EFDATA	Chemical formula for reactant (monatomic gas or element in its reference form), the $H_f^0$ value, the melting point if any, and the number of temperatures for which there are binary EF data following this card	Yes
Binary EF data	Enthalpy and free energy data for the reactants. These data for each reactant consist of a set of column binary cards; the number of cards depends on the amount of data. Each set must be preceded by the EFDATA card which identifies it (see previous card).	Yes
Specific data		
Formula	Chemical formula of species (This card may also contain a heat of formation and its corresponding temperature)	No
TEMP	Temperature schedule	Yes
REFNCE	Numbers to identify input data sources	Yes
EFTAPE	Code in card columns 1 to 6 only which calls for EF DATA and corresponding binary EF data cards to be punched and for the data to be put on tape	Yes
LOGK	Code in card columns 1 to 4 only which calls for tables of thermodynamic properties including $\Delta H_f^0$ and log K	Yes
LSTSQS	Temperature intervals for a least-squares fit, temperature exponents in the polynomial, and a temperature where the data are to be constrained	Yes
INTERM	Code in card columns 1 to 6 only which calls for intermediate output	Yes
DATE	Date which will be punched with least-squares coefficients	Yes
METHOD	A method code which specifies the method for obtaining thermodynamic functions; for example, RRHO or PANDK for diatomic or polyatomic gases, or READIN for reading in the functions directly	No
DATA	Data required by method given on METHOD card	No
FINISH	Code in card columns 1 to 6 only which indicates the end of a set of specific data	No

TABLE IV. - CONTENTS OF FORMULA CARDS

Labels 2, 3, or 4	Numerical value	Comments
HF298	An assigned enthalpy $H_{298.15}^0$	Numerically equal to heat of formation at 298.15°K
ASINDH	An assigned enthalpy, $H_T^0$	-----
DISSOC	Dissociation energy ( $D_T^0$ or $-\Delta H_T^0$ )	-----
DELTAH	Heat of formation from the assigned reference elements ( $\Delta H_T^0$ )	-----
IPATOM <sup>b</sup> (ions only)	Heat of ionization from the electron and neutral atom	-----
INVCM	(blank)	Units are $\text{cm}^{-1}/\text{mole}$
CAL	(blank)	Units are cal/mole
KCAL	(a) (blank)	Units are kcal/mole
EV	(blank)	Units are eV/mole
JOULES	(blank)	Units are J/mole
T	Temperature	Not required with HF298

<sup>a</sup>Use only one.<sup>b</sup>The following are examples of IPATOM:

$$\text{IPATOM} = 104995.46 \text{ cm}^{-1} \text{ (refs. 18 and 20)}$$

$$\text{IPATOM} = 296995.46 \text{ cm}^{-1} \text{ (refs. 18 and 20)}$$

$$\text{IPATOM} = -3.613 \text{ eV} \text{ (ref. 34).}$$

TABLE V. - CONTENTS OF OPTIONAL SPECIFIC DATA CARDS

Card col- umns 1 to 6	Labels 1, 2, 3, or 4	Numerical value	Comments
REFNCE	Any alpha- numeric characters	Any numbers within the machine capabilities	-----
EFTAPE	(blank)	(blank)	Code calling for the $H_0^0$ value and the $\frac{H_T^0 - H_0^0}{RT}$ and $-\frac{(F_T^0 - H_0^0)}{RT}$ data to be put on tape and punched for future log K and $\Delta H_T^0$ calcu- lations
LOGK	(blank)	(blank)	Code calling for $\Delta H_T^0$ and log K calculations
LSTSQS	T	Temperature ( $^0\text{K}$ ) at the beginning or end of interval to be fit	Card calls for a least-squares fit
	EXP	Temperature exponent	$q_i$ values in equation (10)
	TCONST	Temperature constraint, $^0\text{K}$	Calls for the data at this tempera- ture to be fitted exactly. Numeri- cal value of T must be the same as some value in the T interval schedule. If omitted, it is assumed to be the melting point, if there is one; otherwise, $1000^0\text{ K}$ .
INTERM	(blank)	(blank)	Calls for intermediate output data
DATE	(any six op- tional char- acters)	(blank)	Punches the label as the last word on the binary least-squares coeffi- cient cards
TEMP	T	Temperature, $^0\text{K}$	This may be a single value or the beginning or end of an interval
	I	Temperature increment, $^0\text{K}$	This must be preceded by a lower and followed by a higher T value. (See section TEMP card(s).)

TABLE VI. - CONTENTS OF METHOD CARDS

Method code (any label)	Type of species	Labels 1, 2, 3, or 4	Numerical value	Comments	
READIN	All species		(blank)	Read in functions directly.	
		H298H0	$H_T^0 - H_0^0$	Used in obtaining $H_T^0 - H_0^0$ values when $H_T^0 - H_{298.15}^0$ values are given on DATA cards	
		MELTPPT	Melting point	Should be included when a set of specific data has both solid and liquid phases	
COEF	All species		(blank)	Calculate functions from empirical equations.	
		REDUCE	(blank)	Coefficients on DATA cards are those of equations (10) to (12) divided by R.	
		MELTPPT	Melting point	See MELTPPT under READIN.	
		DELTAH	Heat of transition	Used between two phases of the same species; code is on METHOD card of second phase	
FIXEDN	Monatomic gases		DELtas	Entropy of transition	May be used in lieu of a heat of transition (see label DELTAH)
			Highest principal quantum number to be included in calculations	All energy levels whose principal quantum number is less than or equal to this number will be included	
		FILL	(blank)	Missing energy levels will be estimated and included as discussed in the section Inclusion of predicted levels	
ALLN	Monatomic gases		(blank)	Include all levels given in input.	
TEMPER	Monatomic gases	FILL	(blank)	See FILL option under FIXEDN.	
RRHO	Diatomnic and polyatomic gases	FILL	(blank)	Cut off all levels above "reduced" ionization potential (See section Internal Partition Function for Monatomic Gases.)	
PANDK	Diatomnic and polyatomic gases	-	(blank)	See FILL option under FIXEDN.	
JANAF	Diatomnic and polyatomic gases		(blank)	Rigid-rotator harmonic-oscillator approximation (See table I.)	
NRRAO1	Diatomnic and polyatomic gases		(blank)	Calculation method of reference 3 (See tables I and II.)	
NRRAO2	Diatomnic and polyatomic gases		(blank)	Calculation method of reference 2 (See tables I and II.)	
			(blank)	Calculation method of references 30 and 31 (See tables I and II.)	
			(blank)	Same as NRRAO1 with some higher order corrections (See tables I and II.)	

TABLE VII. - CONTENTS OF DATA CARDS

Method	Labels 1, 2, 3, or 4	Numerical value	Comments
READIN	T	Temperature in $^{\circ}\text{K}$	One value on each card
	CP	$C_p^0$	Either one of these values on each card
	CP/R	$C_p^0/R$	
	H-H0	$H_T^0 - H_0^0$	Any one of these values on each card
	H-H2	$H_T^0 - H_{298.15}^0$	
	H-H0/T	$(H_T^0 - H_0^0)/T$	
	H-H2/T	$(H_T^0 - H_{298.15}^0)/T$	
	H-H0RT	$(H_T^0 - H_0^0)/RT$	
	H-H2RT	$(H_T^0 - H_{298.15}^0)/RT$	
	S	$S_T^0$	Any one of these values on each card
COEF	S/R	$S_T^0/R$	
	-F-H0	$-(F_T^0 - H_0^0)$	
	-F-H2	$-(F_T^0 - H_{298.15}^0)$	
	-FH0/T	$-(F_T^0 - H_0^0)/T$	
	-FH2/T	$-(F_T^0 - H_{298.15}^0)/T$	
	-FH0RT	$-(F_T^0 - H_0^0)/RT$	
	-FH2RT	$-(F_T^0 - H_{298.15}^0)/RT$	
	See comments	-----	First card may be the same as aforementioned READIN card with $C_p^0$ or $C_p^0/R$ value omitted. The data will be used in obtaining the integration constants, $a_{r+1}$ and $a_{r+2}$ , in equations (10) to (12).

T	Temperature at beginning or end of temperature range	Two T labels must precede exponents and coefficients for the temperature range.
Ei( $i = 1, 2, \dots, 10$ )	$q_i$ in equation (10)	-----
Ci( $i = 1, 2, \dots, 10$ )	$a_i$ or $a_i/R$ in equation (10)	$a_i/R$ with REDUCE code in METHOD card
CH	$a_{r+1}$ (eq. (11))	Use one if $a_{r+1}$ has not been set by previous enthalpy value.
CH/R	$a_{r+1}/R$ (eq. (11))	
CH-H0	$a_{r+1} - H_0^0$ (eq. (11))	
CHH0/R	$(a_{r+1} - H_0^0)/R$ (eq. (11))	
CS	$a_{r+2}$ (eq. (12))	Use one if $a_{r+2}$ has not been set by previous entropy value.
CS/R	$a_{r+2}/R$ (eq. (12))	
TPUNCH	Temperature value to be punched on coefficient cards	Calls for cards to be punched (See appendix E)
FIXEDN, ALLN, or TEMPER <sup>a</sup>	IP	Ionization potential in $\text{cm}^{-1}$ Required only with TEMPER
	$J_m$ value	$\epsilon_m/hc$ in $\text{cm}^{-1}$ (eq. (7)) $J_m$ value (1) does not have to be right- or left-adjusted (2) may be integer, 0, or decimal number (if decimal, it can have only 5 or 0 to right of decimal point) (3) must be punched if 0

<sup>a</sup>For FILL option (METHOD card) or FIXEDN, the principal quantum number for the data on each card must be in card columns 79 to 80, right-adjusted.

TABLE VII. - Concluded. CONTENTS OF DATA CARDS

Method	Labels 1, 2, 3, or 4	Numerical value	Comments
RRHO, PANDK, JANAF, NRRHO1, or NRRHO2 <sup>b</sup>	SYMNO	Symmetry number	Taken to be 1 if omitted
	STATWT	Statistical weight	Taken to be 1 if omitted
	T0	$T_0$	Use with excited electronic state.
	B0	$B_0$	$B_e$ , $B_0$ , or $I_B$ value must be included for all molecules.
	BE	$B_e$	See comments for label $B_0$ . Use only for linear molecules.
	WE	$\omega_e$	Diatomics only
	WXEXE	$\omega_e^x e$	
	WEYE	$\omega_e^y e$	
	WEZE	$\omega_e^z e$	
	WX4	Anharmonic constant one order higher than $\omega_e^z e$	
ALPHAE	$\alpha_e$		
	$\alpha_i$ (See comments for definition.)		Diatomics only. $B_v = B_e - \alpha_1 \left( v + \frac{1}{2} \right) + \alpha_2 \left( v + \frac{1}{2} \right)^2 + \alpha_3 \left( v + \frac{1}{2} \right)^3$
ALFABI ( $i \leq 6$ )	$\alpha_i$	Linear polyatomics only. $B_{[v]} = B_e - \sum_{i=1}^{n \leq 6} \left[ \alpha_i \left( v_i + \frac{d_i}{2} \right) + \sum_{j \geq i}^{n \leq 6} \alpha_{ij} \left( v_i + \frac{d_i}{2} \right) \left( v_j + \frac{d_j}{2} \right) \right]$	
ALFAij ( $i, j \leq 6$ )	$\alpha_{ij}$		
ALFAAi ( $i \leq 6$ )	$\alpha_i^A$	Nonlinear molecules only. $A_{[v]} = A_e - \sum_{i=1}^{n \leq 6} \alpha_i^A \left( v_i + \frac{d_i}{2} \right)$	where $v_i$ and $d_i$ are the vibrational quantum number and degeneracy respectively for the $i^{\text{th}}$ fundamental frequency
ALFABI ( $i \leq 6$ )	$\alpha_i^B$	Nonlinear molecules only. $B_{[v]} = B_e - \sum_{i=1}^{n \leq 6} \alpha_i^B \left( v_i + \frac{d_i}{2} \right)$	

ALFACi ( $i \leq 6$ )	$\alpha_i^C$	Nonlinear molecules only. $C_{[v]} = C_e - \sum_{i=1}^{n=6} \alpha_i^C \left( v_i + \frac{d_i}{2} \right)$
DE	$D_e$	Diatomics only
BETAIi ( $i \leq 3$ )	$\beta_i$	Diatomics only, where $D_v = D_e - \sum_{i=1}^{n=3} \beta_i (v + 1/2)^i$
$v_i(d_i)$ or $v_i$ ( $i \leq 20$ )	$v_i(d_i)$ or $v_i$	$d_i$ is degeneracy (an integer) of $v_i$ and may be omitted when $d_i = 1$
Xij ( $i \leq 6$ , $j \leq 6$ )	$x_{ij}$	Polyatomics only
Yijk ( $i \leq 6$ , $j \leq 6$ , $k \leq 6$ )	$y_{ijk}$	Polyatomics only
W0	$W_0$ (Fermi resonance constant)	Linear polyatomics only
Gii ( $i \leq 6$ )	$g_{ii}$	Linear polyatomics only
D0 or D000	$D_0$ or $D_{000}$	Polyatomics only
RHO	$\rho$ , $^{\circ}\text{K}^{-1}$	Polyatomics only
A0	$A_0$	An $I_A$ or $A_0$ must be included for all nonlinear polyatomics.
C0	$C_0$	An $I_C$ or $C_0$ must be included for all nonlinear polyatomics.
IB	$I_B \times 10^{39}$ , (g)(cm $^2$ )	See comments for label $B_0$ .
IA	$I_A \times 10^{39}$ , (g)(cm $^2$ )	See comments for label $A_0$ .
IC	$I_C \times 10^{39}$ , (g)(cm $^2$ )	See comments for label $C_0$ .

<sup>b</sup>For excited electronic states, the data for each state should be put on separate cards with an identifying number in card columns 79 to 80. Data cards for each state must be grouped together.

TABLE VIII. - PUNCHED COEFFICIENT CARDS

Binary word number	Card 1	Card 2 (2 or more intervals)	Cards 3 to 5 as required (5 to 9 intervals)
1	Machine assigned storage		
2	Machine assigned storage		
3	First 6 characters of formula	Same as card 1	Same as card 1
4	Second 6 characters of formula		
5	Ionization potential, if any		
6	Lowest T in intervals or melting point if liquid	$a_{r+2}$ (Second interval)	Lowest T in interval
7	Highest T in intervals or melting point if solid	Fourth highest T	Highest T in interval
8	Second highest T	Third highest T	$a_1$
9	Highest T in interval	$a_1$	$a_2$
10	$a_1$	$a_2$	$a_3$
11	$a_2$	$a_3$	$a_4$
12	$a_3$	$a_4$	$a_5$
13	$a_4$	$a_5$	$a_{r+1}$
14	$a_5$	$a_{r+1}$	$a_{r+2}$
15	$a_{r+1}$ (eq. 11)	$a_{r+2}$	Lowest T in interval
16	$a_{r+2}$ (eq. 12)	Fifth highest T	Highest T in interval
17	Third highest T	Fourth highest T	$a_1$
18	Second highest T	$a_1$	$a_2$
19	$a_1$	$a_2$	$a_3$
20	$a_2$	$a_3$	$a_4$
21	$a_3$	$a_4$	$a_5$
22	$a_4$	$a_5$	$a_{r+1}$
23	$a_5$	$a_{r+1}$	$a_{r+2}$
24	$a_{r+1}$	$a_{r+2}$	

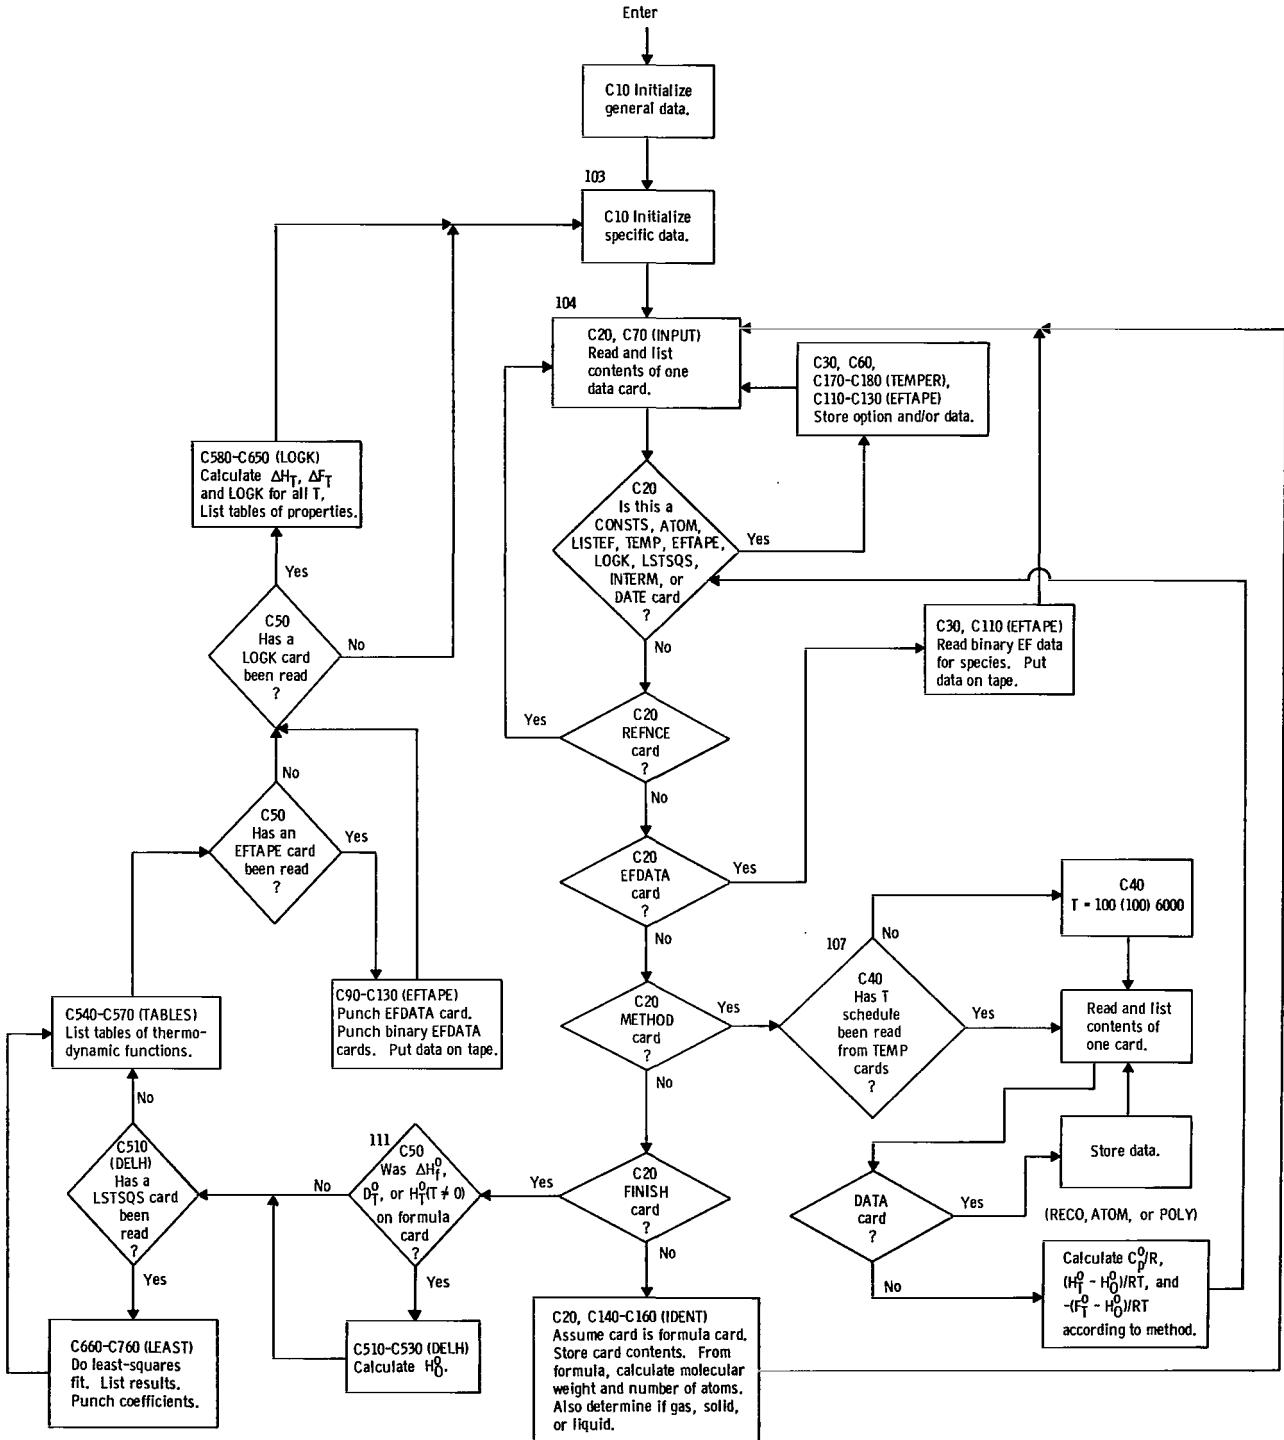

Figure 1. - General flow of program.

*"The aeronautical and space activities of the United States shall be conducted so as to contribute . . . to the expansion of human knowledge of phenomena in the atmosphere and space. The Administration shall provide for the widest practicable and appropriate dissemination of information concerning its activities and the results thereof."*

—NATIONAL AERONAUTICS AND SPACE ACT OF 1958

## NASA SCIENTIFIC AND TECHNICAL PUBLICATIONS

**TECHNICAL REPORTS:** Scientific and technical information considered important, complete, and a lasting contribution to existing knowledge.

**TECHNICAL NOTES:** Information less broad in scope but nevertheless of importance as a contribution to existing knowledge.

**TECHNICAL MEMORANDUMS:** Information receiving limited distribution because of preliminary data, security classification, or other reasons.

**CONTRACTOR REPORTS:** Scientific and technical information generated under a NASA contract or grant and considered an important contribution to existing knowledge.

**TECHNICAL TRANSLATIONS:** Information published in a foreign language considered to merit NASA distribution in English.

**SPECIAL PUBLICATIONS:** Information derived from or of value to NASA activities. Publications include conference proceedings, monographs, data compilations, handbooks, sourcebooks, and special bibliographies.

**TECHNOLOGY UTILIZATION PUBLICATIONS:** Information on technology used by NASA that may be of particular interest in commercial and other non-aerospace applications. Publications include Tech Briefs, Technology Utilization Reports and Notes, and Technology Surveys.

*Details on the availability of these publications may be obtained from:*
